Add fixed end lengths (constant)	.020″
Add .150″ for each mounting hole	″
Total Length*	″

NOTE:
* Maximum length is 6.020″. Maximum number of contacts must be reduced to accommodate hardware and mounting holes. Minimum length is .170″ (3 contact cavities).
** When locating one lockscrew, use the centermost available hole. Also, careful engagement is necessary to prevent damage to the plastic threads.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

Wiring Management Solutions for Virtually any Electrical or Electronic System from Wire Bundling to Printed Circuit Board Accessories

All-States has been manufacturing cable ties since 1968. We also design and manufacture our own production tools and products in our Chicago facilities. Our new management team has instituted an aggressive new product development program to meet changing needs in the electrical and electronic industries.

Materials

All-States Products are available in a variety of engineering injection molded plastics. Nylon 66 is our standard material. UV stabilized and heat-stabilized nylons are available as options. Fire retardant grades of nylon and polypropylene are also available. Products can also be produced in other various grades of polypropylene and polyethylene. High temperature applications can be met through use of Tefzel molded products.

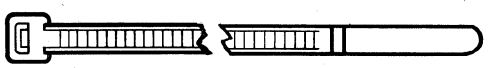
RT and RTH Series Single Loop Cable Ties



RT Series single loop cable ties are available for securing bundle diameters from 1/16″ through 4″. Heavy-duty RTH Series ties secure bundles with diameters of 3/16″ through 14″. The one-piece injection-molded construction provides maximum strength and durability. Closely spaced positive-locking teeth allow secure and finely adjustable bundle fastening. Both series also feature smooth, round edges that protect insulation and hands from cutting. For easy and fast installation around smaller bundles, the RT Series has a bent tip design with sure grip ridges. The RTH Series has a straight tip design with sure grip ridges.

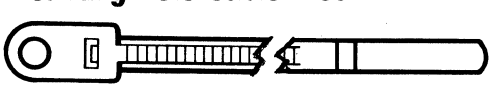
RTM and RTHM Series Mounting Hole Cable Ties



RTM and RTHM Series ties have a molded-in screw hole for mounting bundles in almost any position to virtually any surface. RTM Series ties can secure bundle diameters from 1/16″ through 4″ and feature a bent tip design with sure grip ridges for easy insertion around smaller bundles. RTHM Series ties are extra strong and secure bundle diameters of 3/16″ through 8″ and feature a straight tip desigh with sure grip ridges. Both series have positive-locking teeth and one-piece molded construction for maximum strength and durability.

RTPM Series Push-Mount Cable Ties

RTPM Series ties will snap easily into a 1/4" hole of any panel or chassis up to 1/8" thick and secure bundle diameters of 1/16" through 4". Centering ears and locking barbs prevent release during stress or vibration and spring-arm thickness compensators keep bundle tightly anchored to panel or chassis. One-piece construction and positive-locking teeth assure accurate and secure bundling. Smooth, round edges protect insulation and hands from cutting. Bent tip design allows easy installation.

RTID, RTIDE, & RTIDI Series Identification Cable Ties

All the features and strength of our RT Series cable ties combined with a textured plate allows permanent identification of bundles using All-States' nylon-penetrating marking pens.

RTID Series ID Cable Ties are standard cross-section ties designed for bundle diameters of 3/8" through 4". The ID plate runs perpendicular to the bundle inside the head.

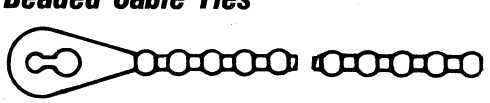
RTIDE Series ID Cable Ties are miniature cross-section ties designed for bundle diameters of 1/16" through 3/4". The ID plate runs perpendicular to the bundle outside the head. Ideal for applications requiring added visibility.

RTIDI Series ID Cable Ties are miniature cross-section ties designed for bundle diameters of 1/4" through 3/4". The ID plate runs parallel to the bundle inside the head.

RTDL Series Double Loop Cable Ties

RTDL ties were designed for dual bundle applications and secure combined maximum bundle diameters of 1-1/2" through 4". Its two way locking head can lock around one bundle like a single loop tie, and also lock around another bundle in a figure eight configuration. The head acts as a spacer between the two bundles. The second loop can even be left unused for future use. One-piece molded construction adds maximum strength. Bent tip design allows easy installation.

Beaded Cable Ties



Beaded cable ties secure bundle diameters of 3/16" through 5". The positive-locking key head secures quickly and tightly yet can be released for almost indefinite reuse, making them especially useful where bundling requirements may change. The smooth round beads do not damage insulation and allow uniform adjustment.

Amphenol Canada

Amphenol Canada has been manufacturing filter connectors for over 25 years. Amphenol has demonstrated industry leadership in the design of filter connectors. Twenty years ago we were the first to use removeable stress-isolated filter contacts in our mil/sero class of connectors. We were also the first to introduce monolithic planar filters. Most recently, we were the first again to extend filter technology through the use of chip capacitors in our connectors. This patented design allowed us to meet the needs of the commercial filter market providing our customers with the lowest cost per line filter connector along with high performance and reliability. Several million connectors utilizing this chip capacitor technology are currently in use by the major computer and telecommunications equipment manufacturers.

Fiber Optic Products

The 953 Series Multimode connectors are precision ST-compatible interfaces manufactured to demanding international performance specifications. These systems incorporate a new connector, a new adapter, and a new method for rapid field terminations. The 953 is constructed of a glass reinforced polymeric body and coupling nut, ceramic ferrule, copper crimp ferrule and PVC bend relief boot allowing the connector to achieve improved insertion loss, durability and environmental insensitivity at the lowest possible cost. The system is based on, and completely compatible with AT&T's recently introduced ST connector. The 953, however, combines the precision of complete ceramic alignment with the economy and durability of a polymer housing to yield improved performance over other ST functional equivalents for both single mode and multimode applications. The termination procedure is considerably more rapid than others available and incorporates special fiber cleaving and polished tools which allow any non-skilled person to obtain low loss interconnects–reliably and very quickly.

Design and Engineering Assistance for Interconnect Components

IC Sockets • PGA Sockets • Molded Stand Off Terminals • Molded Feed Through Terminals and Test Jacks

Andon Electronics Corporation was established to provide the industry with in-depth technical assistance and interconnect components.

Multi-million dollar systems are dependent upon the sum total of all "nickel and dime" interconnects. This presents a challenge for the component manufacturer. At the present time there is a tendency to "copy-cat" rather than improve the state-of-the-art to keep up with the industry.

The personnel at Andon have a proven track record with up to 30 years experience in the aerospace, military, medical, industrial and commercial computer industries.

Our committment to you is to *listen* to your problem, formulate a *design* to fill your requirements and *produce* a product improvement at a cost reduction.

We welcome the opportunity to show you that we are technical problem solvers. Our modern plant is ready to be of service to you.

President

Terminals and Test Jacks
Spline-Loc® Terminals

- Terminals contain knurls which allow material displacement without tearing the board. The Spline-Loc® prevent terminals from spinning and pushing out.
- Andon's Test Jacks are made to rigid specifications for military and commercial use. Andon also features a wide variety of threaded, molded standoffs and feed-thru terminals.

EEM MINIGLOSSARY CONNECTORS

Connector terminology is often quite confusing. This confusion starts with the very names of connectors. The name of a connector may derive from its shape, application, type of conductor or even method of termination.

Shape—Circular, cylindrical, and rectangular.

Electrical application—High voltage, RF, microwave, input/output, etc.

Mechanical application—Printed circuit, rack & panel, cable, etc.

Conductor type—Coaxial, flat cable, ribbon cable, flex circuit, etc.

Termination method—Wirewrap, soldercup, solderless, etc.

Hardware such as clamps, hoods, and adapters are frequently used to convert cable connectors to rack and panel types. This adds to the name confusion. A very common telephone connector, for example (the "C" type) got its name from the model number of the original maker.

Contact: The part(s) of the connector that actually provides circuit continuity between its two sections—the parts which are normally mated. The back end of the connector should properly be called the *termination.* This is the point where the wires or PC board is attached to the connector.

Contact alignments: Often called *contact float.* Describes the amount of allowable contact movement within the connector body. Permits self-alignment.

Male vs. female: In the U.S. this describes the contact construction. In Europe this term is more often used to describe the outer shell mating action which may be the reverse of the contacts.

Closed entry: A female contact which prevents entry of a male contact larger than a specific size.

Open entry: A female contact designed for a specific size of male contact but which will allow entry of larger male contacts by spring action.

Hermaphrodite: Contacts or connector bodies which are the same configuration. Male/female designations do not apply. Bodies usually have some mechanical means for maintaining polarity.

Hermetic seal: Glass-to-metal seals at terminations. Often used improperly to describe vacuum-tight seals.

Waterproof seal: May or may not be truly *waterproof.* May prevent easy entrance of casual water by means of a rubber or other boot.

Printed circuit connector: Connectors which are used in conjunction with printed circuit boards. There are two distinctly different styles.

Edgeboard. May be called *edge* or *card.* The printed circuit (PC) board edge enters the connector.

Two-piece: One part of the connecting pair is physically attached to the PC board itself. The other part is attached to something else such as a cable or a motherboard.

Readout: Describes the arrangement at the terminating edge of a PC board. May be single or double. A double readout PC board has termination strips on each side not usually interconnected.

Ribbon connectors: A type of connector which allows flat "ribbon" cable to be attached to a round or rectangular connector but also used interchangeably for flat connectors to flat cable.

Ribbon contact connector: Describes the contacts in a rectangular connector which have a self-wiping mating action. Not the same as ribbon connector.

Solderless terminal: Any style of termination which does not require solder for a permanent connection. See *crimp* and *insulation displacement.*

Crimp termination: A stripped wire is inserted into a barrel or trough which is then crimped to the conductor with a suitable tool.

Insulation displacement: Unstripped insulated wire is fitted into a channel containing metal teeth which are forced through the insulation to make contact with the conductor.

Service rating: The maximum rated voltage and/or current which may be applied continuously. May be called *working voltage.* Can be confused with the term used to describe how many times a connector may be mated and separated.

Withstanding voltage: Also called *test voltage.* The voltage a connector must withstand for one minute without breakdown. Applied between connectors and between connectors and shell and any grounding devices of the connector.

Beau® Barrier Terminal Strips

CONSIDER THE ADVANTAGES OF BEAU THERMOPLASTIC STRIPS

Beau thermoplastic strips offer many significant advantages. The strong, resilient barriers. The quality and uniformity of the product. Our determined commitment to engineering excellence. And, with our large selection, you're sure to find the strip you need. Design in or cross over to Beau thermoplastic strips—the advantage is yours.

BEND BARRIERS WITHOUT BREAKING

Resilient thermoplastic reduces breakage dramatically. Production line and in-field damage are virtually eliminated.

TERMINAL TAILS ENCLOSED

Cavities are eliminated around solder terminal tails. Allows mounting on PCB without affecting circuit isolation. Eliminates entrapment of foreign matter. Reduces solder wicking.

CLOSED-SIDE STRIPS OFFER EXTRA PROTECTION

Closed side serves as a wire stop. Permits mounting components close to strip without shorting. Wires or screwdrivers can't pass through closed side to contact other wires, leads or PCB components.

HIGHEST U.L. RATING

Our thermoplastic materials all carry the highest U.L. flame retardant rating: UL 94V-0 (self-extinguishing).

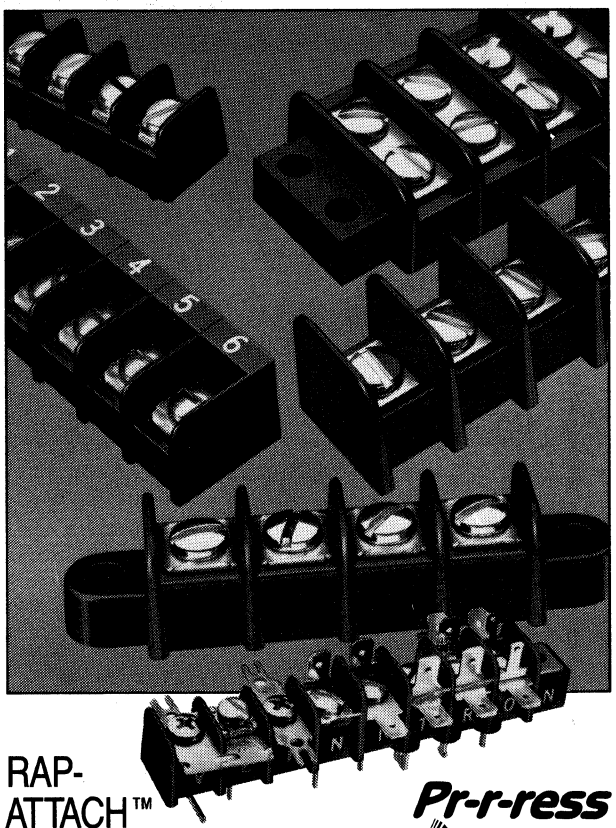
NEAT, ACCURATE MOUNTING ENDS

All our thermoplastic strips are molded to length. None are cut down from longer strips. They're neater, without ugly saw cuts. And they are precisely the same length every time.

WIDE VARIETY OF TERMINALS

There is a broad selection of top-side and bottom terminals—including quick-connect terminals which speed assembly time, cut costs and improve connections.

U.L. RECOGNIZED. CSA CERTIFIED.



RAP-ATTACH™ MOUNTS SAVE 40% OF INSTALLED COST

Rap-Attach mounts (option) are the rapid new way to attach barrier terminal strips to PCBs or panels. Just press in the drive pins. The built-in prongs spread like a blind rivet. It's so easy, you can cut installed cost dramatically.

Non-conductive mounting.
Strain-free joints.
Wave solderable.

Beau® Interconnection Components

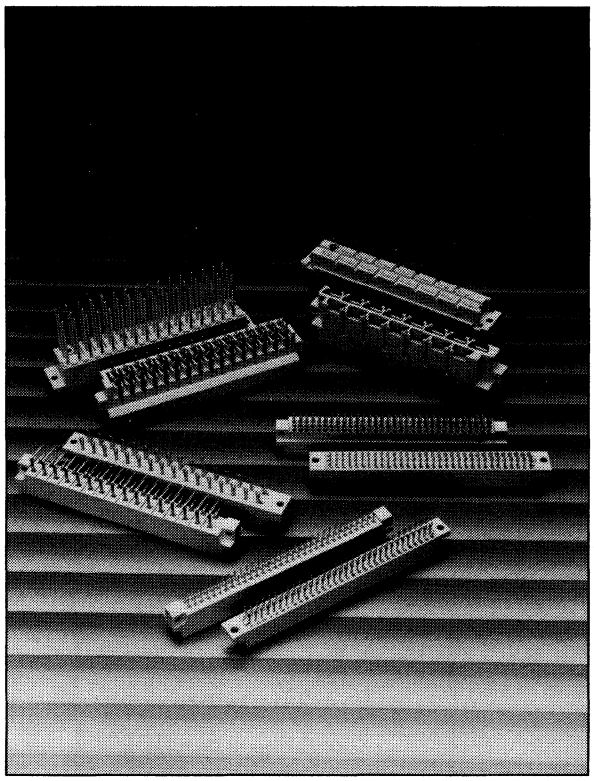
DIN 41612 PC CONNECTORS: MORE CONNECTIONS IN LESS SPACE, FOR LESS MONEY



Vernitron offers DIN 41612 printed circuit connectors that give you economical and highly reliable pin and socket connections to PC boards.

The DIN 41612 connectors also provide much higher contact density than edgeboard PC connectors, while eliminating problems with PC board warpage or variations in thickness. The price per circuit for the DIN connectors is comparable to edgeboard versions, and the amount of gold required on the PC board is greatly reduced.

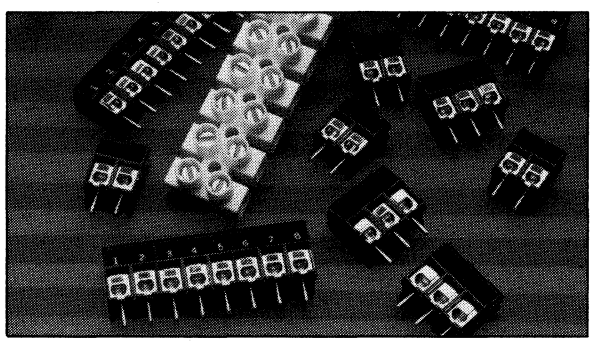
The DIN connectors consist of types B, C, R, D, F, and H, as well as type C connectors for flat cable. They feature contact spacing from .100" to .400", and 11 to 96 contacts, depending on type. All types conform to MIL, DIN, and IEC standards.

New, low-cost contacts.

Types B and C contacts are available with a new bifurcated cantilever option that offers lower cost and lower insertion and withdrawal forces. Tuning fork contact styles are standard.

You can choose from three quality classes of contacts made of copper alloy with hard gold or hard silver-plated finish. Contact tail types include right-angle PC, PC pin, solder lug, wire wrap, wire clamp, and quick-connect.

EUROSTYLE™ TERMINAL STRIPS AND TWO-SCREW TERMINAL STRIPS

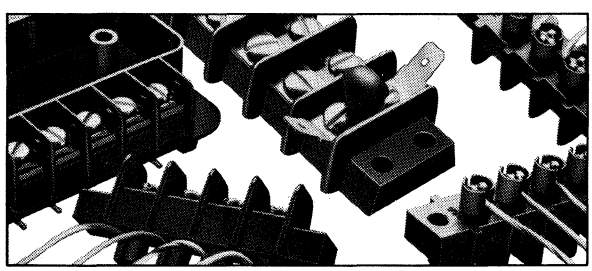


Series 85: These compact, single-row terminal strips are designed especially for PC boards. They can be molded to any length from 2 to 24 positions. Modular in design, they snap together easily while maintaining center-to-center spacing.

The strips have high circuit density (.197" contact spacing), and a very small footprint. Made in USA.

Series C: These two-screw terminal strips also are modular in design. They can be cut into smaller sections with a utility knife, while maintaining center-to-center spacing when installed end to end.

LOW-COST SOLUTIONS TO SPECIAL INTERCONNECTION PROBLEMS



There's almost no limit to the ways we can design cost-saving interconnection devices. By integrating barrier terminal strips with other parts, we can reduce your installed cost. Similarly, blade-type connectors have a wide range of possibilities. We can design for greater electro-mechanical performance, faster assembly, and more. We not only welcome your design problems, we thrive on them.

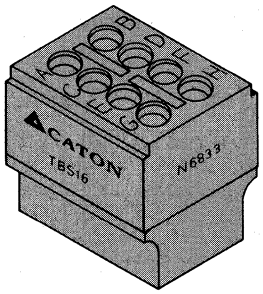
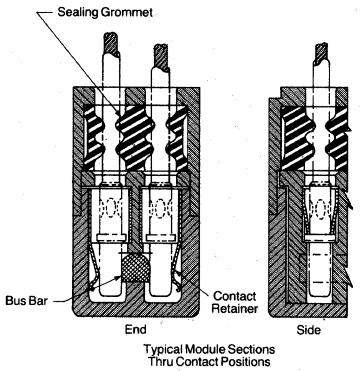
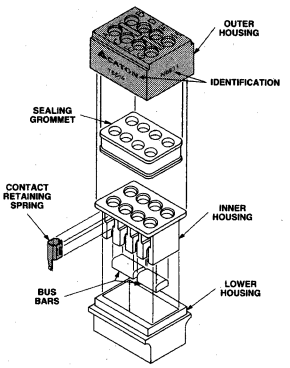
SEALOK®

an Environmentally Sealed Modular Interconnection System





Typical Module Sections Thru Contact Positions



Description

Caton Connector announces **SEALOK**, an environmentally sealed modular interconnection system for shipboard, aircraft, aerospace and many industrial commercial applications where protection against environment is required.

Caton offers in **SEALOK** a compact system that:

- Functions over a wide range of temperature, vibration and shock without variations in contact resistance.
- Protects electrical junctions from humidity and corrosive attack.
- Provides wiring flexibility.
- Can be readily installed and serviced by tools common in industry.

Features

Outer Housing. The outer shell of the **SEALOK** module is constructed in two halves of glass-filled diallyl phthalate, a lightweight thermosetting plastic ***that protects the sealing grommet and other internal components from damage.*** The two halves are bonded in an area where the adhesive will not contaminate contact and locking surfaces.

The hard top of the outer housing:

- Ensures maximum seal effectiveness even if severe training of wires occurs.
- Provides a guide for proper insertion and extraction of contacts.
- Offers a surface for clear identification of contact positions and bussing arrangements.
- Minimizes exposure of sealing gland surfaces to injurious fluids.

CCM Series

High Voltage Cable Assemblies

The **CCM Series** is a basic and proven design. Standard quality materials, customization and a twenty year track record make this series ideal for most High Voltage Corona-Free cable assembly requirements.

Pictured here are some typical cable assembly configurations...but not limited to just these, please consult sales rep or CATON directly with your requirements, **1 thru 8 conductors available.**

The **CCM Series** utilizes standard MIL-C-5015 Class E aluminum shells. The inserts are resilient silicone per ZZ-R-765 with tapered self centering contours. When mated all air is excluded thereby making the connection impervious to the outside environment. All shields are circumferentially terminated using a grounding wedge which provides an excellent ground circuit and overall assembly durability.

Factory terminated assemblies have corona inception voltages of 4 KVAC thru 20 KVAC when measured on a corona test set with a minimum sensitivity of 15 picocoulombs.

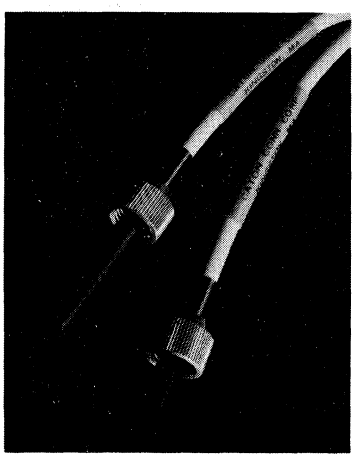
LGG Series

High Voltage Lead Connectors



Tripping of sensitive logic circuitry, power loss and eventual failure are the three main problems Corona can cause. The **CATON LGG Series** is designed for Corona-Free performance... 2½ times superior than AMP assemblies.

CATON assemblies have corona inception voltages of at least 5KVAC as measured on a corona test set with a minimum sensitivity of 5 picocoulombs.

Patented Torq-Tite™ Contact

Offset tines compress and grip conductor to form a gas tight connection impervious to environmental contaminants. Wiping action cleans conductor surface to provide metal to metal contact. The resultant force of the dual torques produces a longterm, Torq-Tile™ connection. The electrical connection on the other end—between the contact and its mate—whether it be a PC board, a pin or a socket, is of equal importance. Structural design, materials, area of contact, surface finish, contact redundancy, and mechanical means of seating the contact in the insulator can be critical. Every CW contact has been designed with full consideration of these factors.

MINIGLOSSARY CONNECTORS

Connector terminology is often quite confusing. This confusion starts with the very names of connectors. The name of a connector may derive from its shape, application, type of conductor or even method of termination.

Shape—Circular, cylindrical, and rectangular.

Electrical application—High voltage, RF, microwave, input/output, etc.

Mechanical application—Printed circuit, rack & panel, cable, etc.

Conductor type—Coaxial, flat cable, ribbon cable, flex circuit, etc.

Termination method—Wirewrap, soldercup, solderless, etc.

Hardware such as clamps, hoods, and adapters are frequently used to convert cable connectors to rack and panel types. This adds to the name confusion. A very common telephone connector, for example (the "C" type) got its name from the model number of the original maker.

Contact: The part(s) of the connector that actually provides circuit continuity between its two sections—the parts which are normally mated. The back end of the connector should properly be called the *termination.* This is the point where the wires or PC board is attached to the connector.

Contact alignments: Often called *contact float.* Describes the amount of allowable contact movement within the connector body. Permits self-alignment.

Male vs. female: In the U.S. this describes the contact construction. In Europe this term is more often used to describe the outer shell mating action which may be the reverse of the contacts.

Closed entry: A female contact which prevents entry of a male contact larger than a specific size.

Open entry: A female contact designed for a specific size of male contact but which will allow entry of larger male contacts by spring action.

Hermaphrodite: Contacts or connector bodies which are the same configuration. Male/female designations do not apply. Bodies usually have some mechanical means for maintaining polarity.

Hermetic seal: Glass-to-metal seals at terminations. Often used improperly to describe vacuum-tight seals.

Waterproof seal: May or may not be truly *waterproof.* May prevent easy entrance of casual water by means of a rubber or other boot.

Printed circuit connector: Connectors which are used in conjunction with printed circuit boards. There are two distinctly different styles.

Edgeboard. May be called *edge* or *card.* The printed circuit (PC) board edge enters the connector.

Two-piece: One part of the connecting pair is physically attached to the PC board itself. The other part is attached to something else such as a cable or a motherboard.

Readout: Describes the arrangement at the terminating edge of a PC board. May be single or double. A double readout PC board has termination strips on each side not usually interconnected.

Ribbon connectors: A type of connector which allows flat "ribbon" cable to be attached to a round or rectangular connector but also used interchangeably for flat connectors to flat cable.

Ribbon contact connector: Describes the contacts in a rectangular connector which have a self-wiping mating action. Not the same as ribbon connector.

Solderless terminal: Any style of termination which does not require solder for a permanent connection. See *crimp* and *insulation displacement.*

Crimp termination: A stripped wire is inserted into a barrel or trough which is then crimped to the conductor with a suitable tool.

Insulation displacement: Unstripped insulated wire is fitted into a channel containing metal teeth which are forced through the insulation to make contact with the conductor.

Service rating: The maximum rated voltage and/or current which may be applied continuously. May be called *working voltage.* Can be confused with the term used to describe how many times a connector may be mated and separated.

Withstanding voltage: Also called *test voltage.* The voltage a connector must withstand for one minute without breakdown. Applied between connectors and between connectors and shell and any grounding devices of the connector.

PV™ Dual-Metal Female Receptacles

The Du Pont PV dual-metal receptacle provides unsurpassed mechanical and electrical performance. Its two-piece design offers durability and reliability. The spring withstands repeated insertions and withdrawals, all the while maintaining constant mechanical pressure on the pins. Excellent electrical conductivity is attained by the high normal force of the receptacle. The wiping action between the contact area and the mating pin cleans the contact surfaces of oxides during insertion and withdrawal. The PV line offers wide design flexibility. There is a choice of three spring thicknesses to help meet specific insertion/withdrawal force requirements. There are four terminal variations in crimp-to-wire sizes from 18 to 36 AWG, and a choice of several gold or tin/lead platings. A complete line of application equipment provides optimum assembly capability for varying production needs.

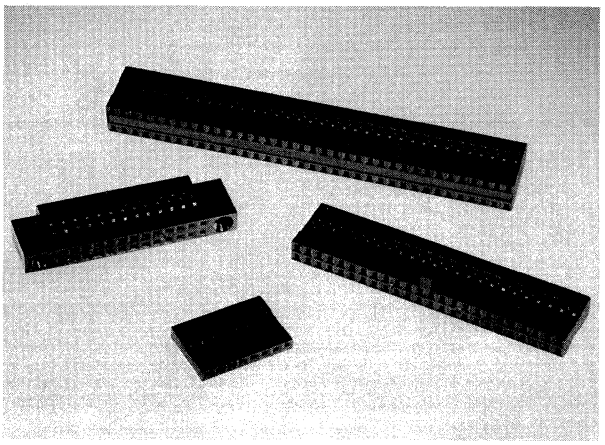
Latch Housings



Latch Housings eliminate the need to make individual connections by providing simultaneous connection of up to 72 PV™ Female Receptacles, shown on the previous page. The PV is retained in the housing by a patented latching mechanism which also permits receptacle removal with a simple tool and without damage to the contact or the housing. Once the PV is released, the latch returns to its original position. The latch housings allow for a variety of design applications. They are available in single- and double-row configurations on various grids, and most are stackable end-to-end and row-to-row. The Mini Latch housing offers the option of a molded-on polarizing feature to ensure the correct orientation of the female connector to the header without loss of a pin position. A bulkhead housing option is also available on the Mini Latch housing to assure a reliable mechanical latch in a flying connection.

Mini Latch Housing

0.025" Square Male Terminals

The 0.025" square terminals are manufactured from drawn wire to provide smooth contact surfaces with 0.002" max. radii that ensure a superior electrical connection. The smooth pin surfaces are easily wiped of oxides when mated to a standard female receptacle in disconnect applications. The sharp corners provided by the drawn-wire process are excellent wire-wrapping points and provide a gas-tight connection. A variety of male pins is available. The BergPin™ 0.025" square male disconnect has a star-shaped wedge at the area of board staking for superior retention in a 0.032" diam. hole. The TriPin™ 0.025" square male disconnect has a tri-area spring action section for press fitting in a 0.039" diam. hole in a 0.125" printed circuit board. The BergPost™ 0.025" square male disconnect has a ferrule for superior staking retention in a 0.049" diam. hole in a 0.0625" printed circuit board. All are available in different lengths for different PC board applications. Three staking machines are available to meet specific production requirements. Models range from a standard semi-automatic unit to a numerically controlled machine that stakes up to 12,000 pins per hour.

INTERCONNECT AND PACKAGING PRODUCTS

QUICKIE™ III IDC SYSTEM

The Quickie III system includes a complete line of female connectors, straight and right angle headers, and edge card connectors. Products are available in a variety of sizes ranging from 6 to 64 positions.

The female connector has a single-beam, long-wipe contact that provides a highly reliable electrical connection. A pre-installed bridge-type cover protects the contacts during handling and provides precise cover-to-base alignment during installation. It also reduces the assembly time required during connector installation.

Quickie III headers feature a unique duplex-plated pin with two-sided plating in the contact area; whereas, the two contact sides of the pin are plated in either gold or GXT, and the two noncontact sides of the pin are plated with gold flash. The solder-tail portion of the pin is fully plated with tin/lead.

These headers also feature four-wall shielding that protects the pin when the header is unmated, and dual-function latches that both lock and eject a mated connector.

Clincher™ Connector Mass Termination System

The Du Pont Clincher™ system mass terminates flat conductor, flat cable or flex circuitry used in packaging applications requiring maximum flexibility and optimum space and weight savings.

The female Clincher™ simultaneously terminates all cable conductors without stripping and is ready for production use within 15 seconds, substantially reducing total installed cost over individually terminated methods. The Clincher™ assembly mates to 0,64 mm (0.025 in.) pins or headers on 2,54 mm (0.100 in.) centers to form a complete interconnection system.

The male Clincher™ offers the same features as its female counterpart. It can also be used to make a flying connection to a female Clincher™, PV™/housing assembly, or any other receptacle which can mate to 0,64 mm (0.025 in.) square pins.

The Clincher™ Solder Tab is designed to mass terminate flat, flexible cable and circuitry for soldering to a printed circuit board.

Easy-to-operate application equipment completes the Clincher™ system.

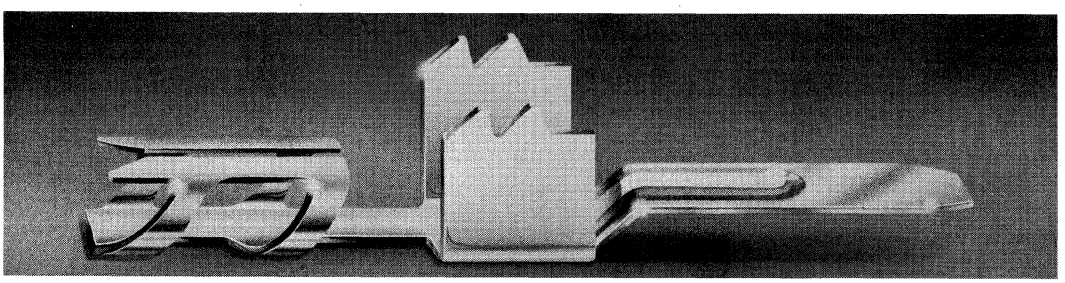
Rib-Cage™ II 0.050 Inch Connector for High Density Packaging



The new Rib-Cage™ II connector on 0.050 inch centers is designed for high density, low profile printed circuit board packaging. It is available in both surface-mount and through-mount configurations. The low profile of the connector allows for tight parallel board packaging.

Rib-Cage II is available in a double-row vertical card connector configuration in two by five through two by fifty positions, in increments of two by five. The contacts are duplex-plated with 30 microinches of gold in the contact area, providing gold only where needed for a more reliable and economical connector.

Rib-Cage II connectors are designed for low profile systems requiring high density. The connectors require only one-eighth the space of 0.100 inch connectors with the same number of contacts.

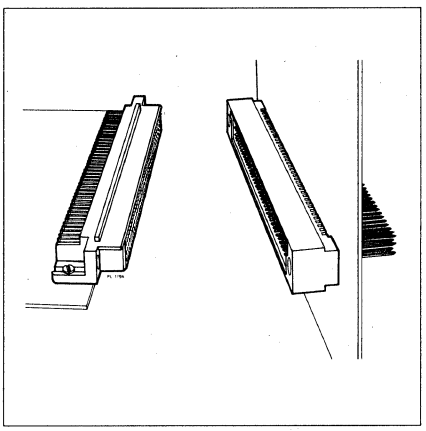
HPC Interconnect System

A high density, low insertion force backpanel-to-daughter board 3 and 4 row I/O system

Features

- High normal force of 75 grams per beam approximately twice that of connectors at a comparable insertion force.
- Early entry, long wipe—with contacts at the outer edge of the female receptacle. Each inserted pin wipes its full length, assuring contact even if PC boards are bowed.
- Plastic lead-in guards against damage to the female receptacle during mating—especially useful if "blind" matings are needed.
- HPC systems can be ordered with staggered mating pin lengths. Specified pins can make contact first, break contact last. Ground or power pins can connect before other pins to protect against chip burn-out.



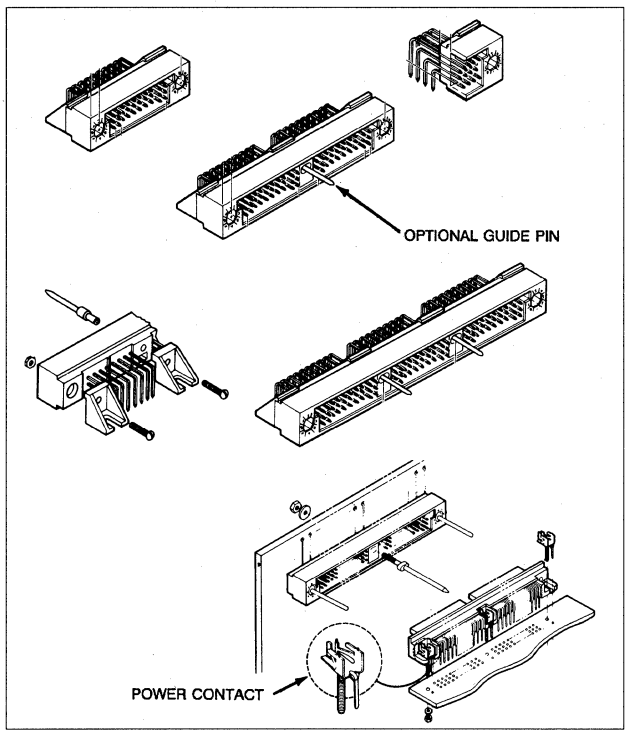
Housings:

Material—Female	Thermoplastic (UL94V-0), black, up-to 150 positions per row
Material—Male	Glass-filled thermoplastic (UL94V-0), color black, up-to 150 positions per row

Contact:

Material—Female	Beryllium-copper alloy
Material—Male	Phosphor-bronze, 3/4 hard per ASTM B-159
Plating	30 µ in. gold, 30 µ in. GXT
Leg Length	Various
Grid	2,54 x 2,54 mm (0.100 x 0.100 in.)

3 and 4 Row Right Angle Header



Power and Static Discharge

Hardware is available for HPC product that can be used for static discharge or conducting power. The gold-plated power guide pins and contacts conduct power up to 20 amps from backplane to card at guide pin and end boss locations. Static discharge hardware is physically identical to power hardware except for being nickel plated.

Custom Terminators

Du Pont I/O terminators are designed to provide a known impedance at the end of a bus line improving signal and data integrity by controlling reflections back through the system.

These pluggable terminators were developed on 0.100 inch, 0.085 inch and 0.109 inch centers to meet industry needs for SCSI (Small Computer Systems Interface), SMD (Storage Module Device) and IPI (Intelligent Peripheral Interface) system communications standards. Custom resistor networks can also be developed and adapted to customer interconnect requirements.

Pluggable terminators by Du Pont will simplify changes in peripheral equipment and save valuable printed circuit board real estate previously occupied by discrete resistors.

For more details, ask for Bulletin 2307 or see General Catalog 88-B.

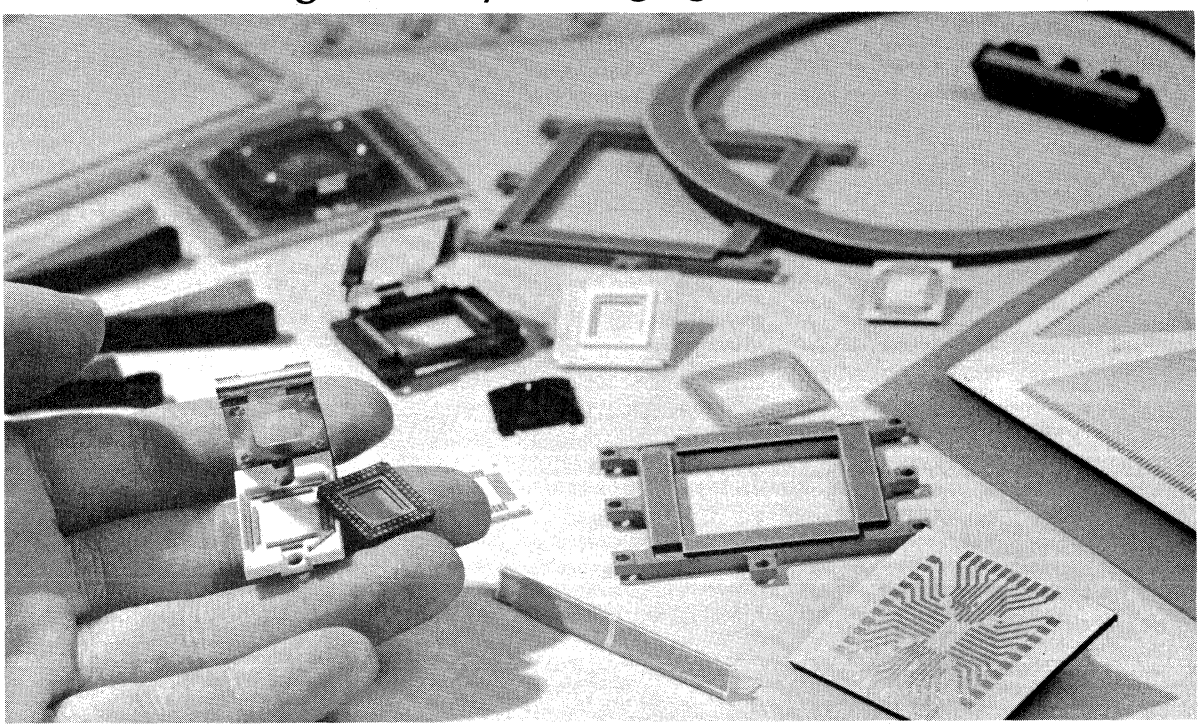
ENGINEERED SOLUTIONS

For *Reliable* High Density Packaging Without *Solder* or *Pins!*



Elastomeric Connectors From ETI For:

- ☐ **Surface Mount Compatibility**
- ☐ **High Contact Density**
- ☐ **Remateability**
- ☐ **Environmental Contact Sealing**
- ☐ **Low Profile Board Spacing**
- ☐ **High Speed Compatibility**

High density packaging without solder or pins...sounds almost too good to be true, but in fact, it's something we've been doing for many years. At ETI, we make it possible through the use of elastomeric connectors which have proven, long-term reliability in a variety of applications. Our technology enables us to design unique inter-connection systems that solve a wide range of packaging problems, such as connections for board-to-board, chip-carrier sockets, test fixtures, flat-panel displays, etc.

Elastomeric connector elements are available in two types; STAX and MOEs (Metal On Elastomers). STAX are composed of alternating layers of conductive and non-conductive silicone rubber. Silver is used as the conductive material where low resistance contact is desired, while carbon is used for higher resistance contact to liquid crystal displays. MOEs have metal traces deposited on a silicone substrate, providing either redundant or dedicated paths for low resistance connection.

STAX and MOEs create reliable contact when clamped between closely spaced pads on mated substrates. Gas tight seals exclude harsh environments over a wide temperature range. Silicone rubber's superior electrical properties ensure low capacitance and dielectric loss over the entire temperature range at up to 100% relative humidity.

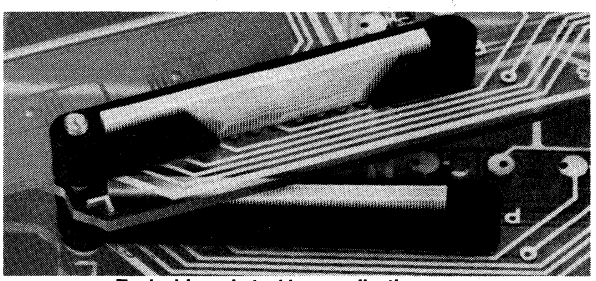
LET US DESIGN AN ELASTOMERIC INTERCONNECTION SYSTEM FOR ALL YOUR PACKAGING NEEDS

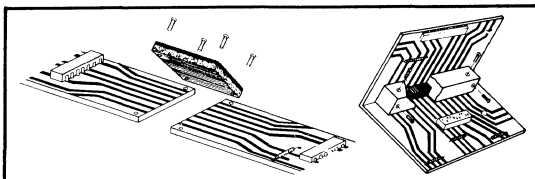
Here are some typical applications

☐ Board-to-Board

Board interconnection is easy with elastomeric connectors. The STAX and MOEs provide redundant connections when compressed between surface contact pads as tightly spaced as .025" center-to-center. We can design and provide an entire connection system including holders, hardware, and board layout. STAX and MOEs make it easy and cost effective.



Typical board-stacking application

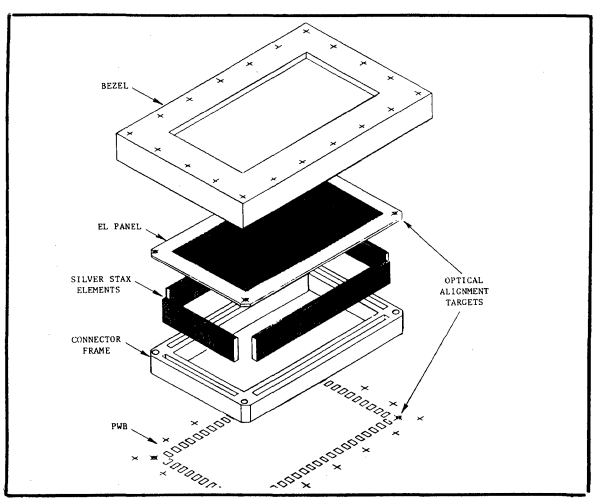


Typical coplanar connection

Typical right angle connection

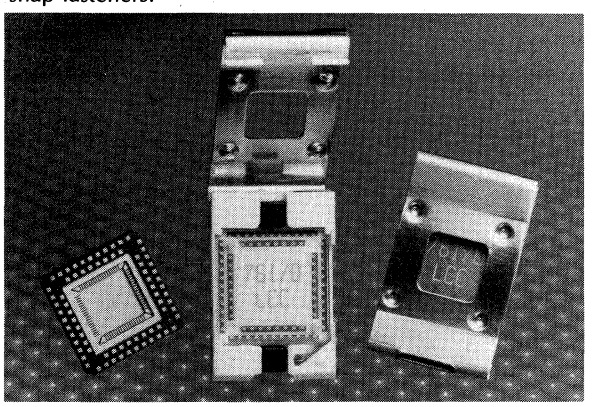
☐ Flat Panel Displays

Elastomeric Connectors provide redundant connections to tightly spaced pads on Electroluminescent, Plasma, Liquid Crystal, LED, and other displays while sealing out contaminates and making alignment less critical.



☐ Chip Carrier Sockets

By eliminating soldering and plated through-holes, leadless chip carrier sockets that use STAX or MOEs simplify assembly and replacement, while saving considerable board real estate. The use of Silver STAX also allows very low profile packages. Lead lengths can be shortened to reduce inductance for high speed compatability. Several mounting options are possible including screws, eyelets, rivets, and snap fasteners.



☐ Test Fixtures

MOEs maintain low resistance, repeatable connections through a broad temperature range, making them ideal for test applications. Since their patterns are artwork generated, they are readily adaptable to a wide variety of devices and substrates such as hybrids, chip carriers, etc. Below are just some of the types of patterns used in test applications. Let the Applications Engineering Department at ETI show you how to use MOE's for your testing requirements.

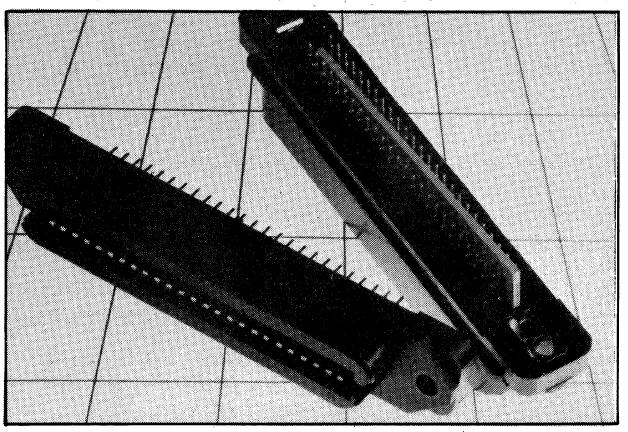
Discrete Connectors from Elfab



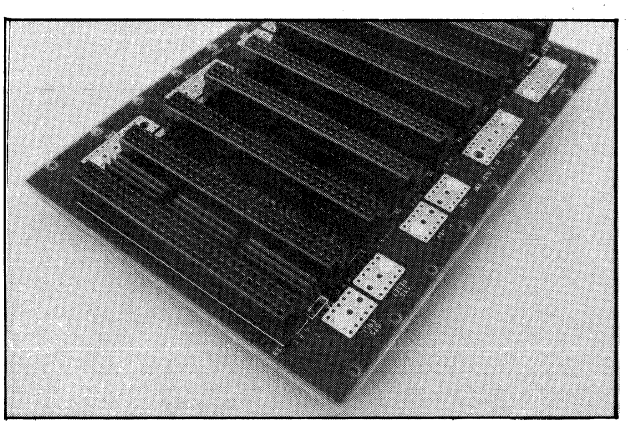
Tele Pac®

Used throughout the telecommunications industry in a variety of applications, the Tele Pac® connector mates with other industry standard connectors of its type. Tele Pac® is available in both solder and press fit styles with an all plastic housing. Although this PCB mounted connector is primarily intended as an I/O interface (cable to board), it can also be used as a board to board interface.

Adding a capacitor element to the standard version provides an EMI/RFI filtering capability which can eliminate the need for expensive shielded cable.

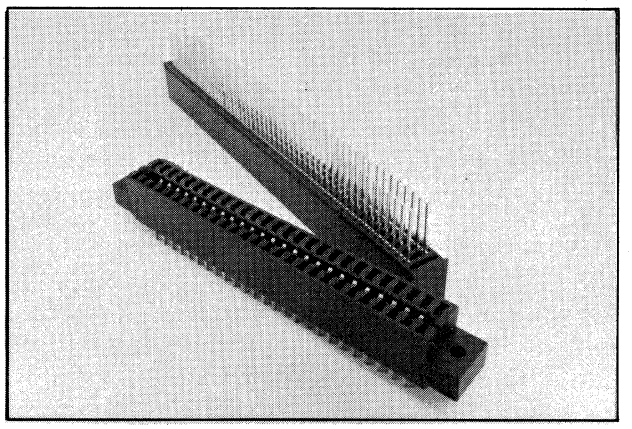
FEATURES:

- Press fit assembly without "special" assembly tooling. Only a flat plate press and board support fixture are required for assembly of press fit connectors
- Custom filters available for EMI/RFI "noise" suppression



VME Backplane

Elfab VME backplanes are designed to meet industry standard requirements. They are offered in 5, 9, 12, 20 and 21 slot configurations. Our VME backplanes are 100% electrically tested prior to leaving our factory to ensure total reliability.



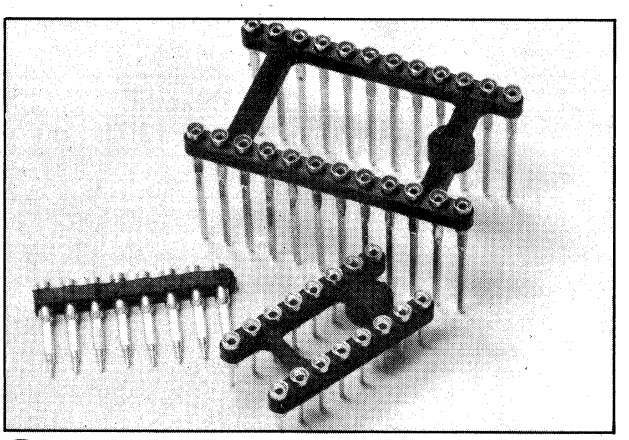
Value Pac™

Value Pac™ card edge connectors are available in solder and compliant pin press fit styles with a variety of tail lengths to provide direct interchangeability with most currently available connectors.

For the ultimate in simplicity, the assembly of press fit connectors requires only a flat plate to press directly on top of the insulator housing. No special tooling is required.

FEATURES:

- Available in three grid sizes: .100 × .200, .125 × .250, .156 × .200
- Available in both .550 and .610 high housings with .410 card slot depth
- Selective plating for efficient gold use



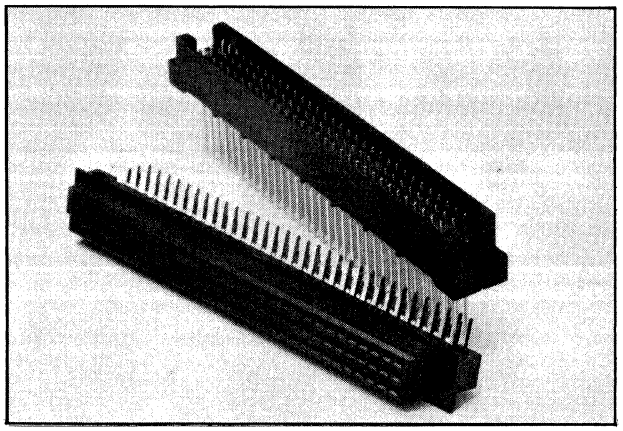
Soc Pac®

Soc Pac® precision I.C. socket connectors are available in either standard SIP or DIP configurations as well as loose pins. All connector sizes are available in standard solder or new press fit styles with 0, 2, or 3 level wire wrap tail lengths.

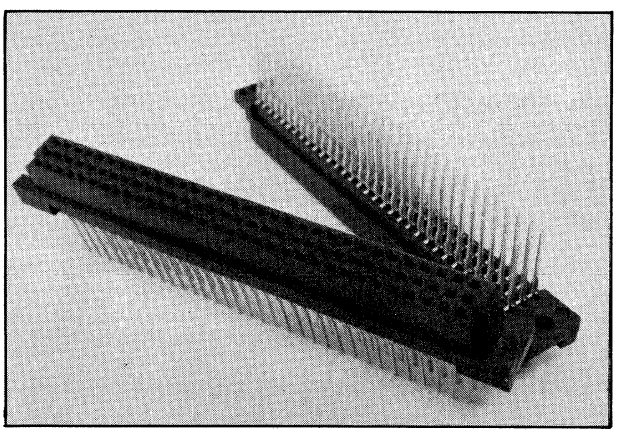
FEATURES:

- Precision machined brass body
- Beryllium copper spring contact
- 100% oriented contact clip
- Wire wrap tail allows rear plug up of box connectors

Discrete Connectors from Elfab



Inverse DIN



Standard DIN

DIN Connectors

The DIN connectors are primarily used as a board to board interface system. These connectors are directly interchangeable with others designed to meet the international DIN 41612 standards. The standard and inverse versions differ only in the placement of the plug and receptacle connectors. In the standard application, the receptacle or female connector is backplane or rack mounted. In the inverse application, the plug or male connector is utilized in this location. Backplane mounted connectors in both versions are offered in either solder or compliant pin press fit styles. The DIN series is an excellent alternative to a card edge connector system as it offers greater contact density and lower insertion forces at comparable per line cost.

FEATURES:

- Rear shrouds available for rear cable or board interface
- Solder and wire wrap tails available

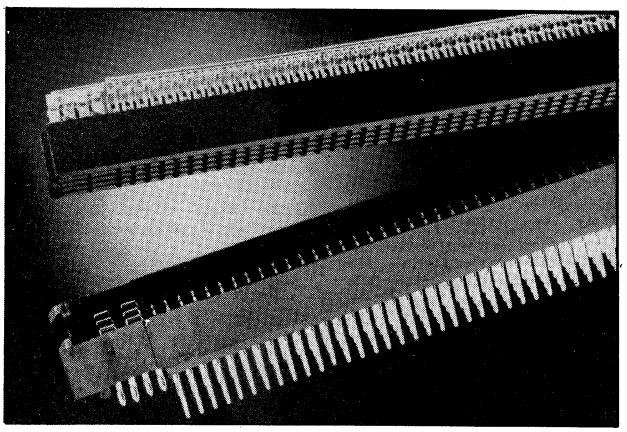
Quality and Innovation

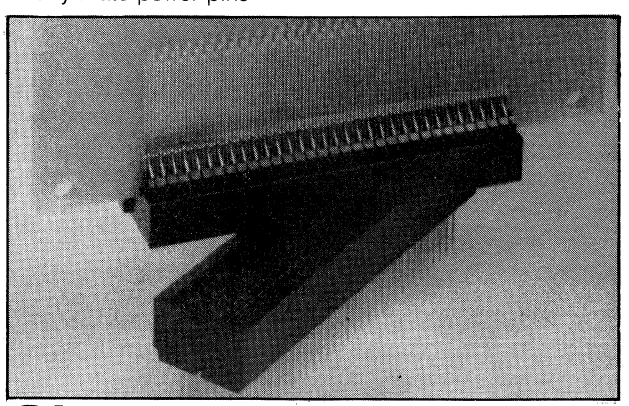


Four Row Box Pac™

The Four Row Box Pac™ high density interconnect system has 4 rows on .100 grid. This system allows for the shortest conductor path between module board and backpanel, with consistency of distance between all four rows. The female surface mount adapts to either vapor phase or reflow soldering. The male is available in either press fit or solder tail.

FEATURES:

- Optional power and ground busses
- Optional keying
- Low insertion force
- Early mate power pins



Six Row "Double-Din"

The six row version of the Four Row Box Pac (above) is double the density of a standard DIN connector. Available immediately from production with 6 rows, 32 pins per row. Female surface mount connector allows for the shortest conductor path between module board and backpanel with consistency of distance between all 6 rows. It adapts to either vapor phase or reflow solder. The male connector is available in either press fit or solder tail.

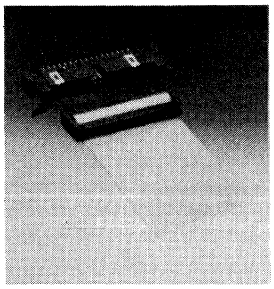
CONNECTORS

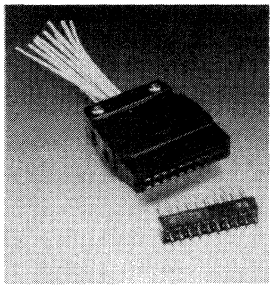
IDC SOCKETS & HEADERS
MODEL FCN-700, FCN-600



FEATURES:

The Model 700 connector has a superior ejector with a unique flexible hook. Header terminals are tin-plated and have superior cost performance; the solder dip section is made into a 0.5 mm (0.020 in.) square and can be used in a ∅0.8 mm (0.031 in.) through-hole. A special strain relief prevents wire breakage, and incorrect insertion is prevented by two kinds of keys and bump polarization. Connectors with 4 mm (0.157 in.) terminals have also been serialized for mounting on multi-layer PC boards. 10-64 positions. Stackable headers available.

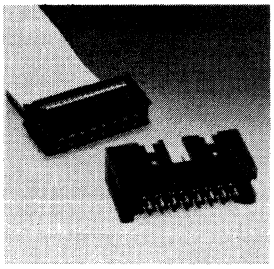
SOCKET HOUSINGS, CRIMP CONTACTS & HEADERS
MODEL FCN-720



FEATURES:

This crimp connector has been designed for wide use, and comes in many shapes and contact arrangements (one and two rows). The Model 720 block headers are matable with the Model 700 and 740 sockets, and Model 720 sockets are lockable with Model 700 headers when a special cover is used. Female contacts are secured in the housing by a unique internal spring structure. High-pressure contacts are also available which prevent accidental disconnection in applications using only a few contacts. For the W and S type headers, insulation molds can be broken into the necessary size. 0.100″ pitch (2.54mm) & .079″ pitch (2mm)

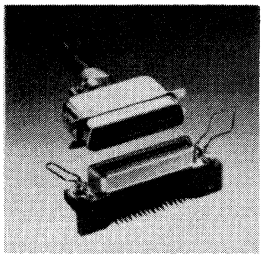
MINI IDC SOCKETS & HEADERS
MODEL FCN-740



FEATURES

This mini-header and socket were developed to provide a compact set of connectors—their combined height is less than half that of the Model 700 connector. Unique plastic retention clips prevent disconnection due to vibration. There are up to 34 contact header and socket combinations, and the socket can be mated with all contact numbers of the FCN-700 header with S hooks and locked. The mini-header has an integral polarization to ensure correct insertion.

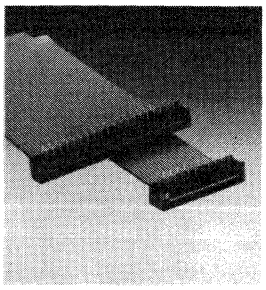
RIBBON CONTACT TYPE CONNECTORS
MODEL FCN-780/FCN-680



FEATURES

- The connectors are matable with other ribbon-type connectors, and have a sturdy metal shell that enables easy EMI shieldings.
- The connectors are made of PBT, a superior solvent-resistant material, enabling flux cleaning with chlorisin and other solvents.
- UL-recognized (94V-0) insulation material is used.
- 1.27 mm (0.050 in.) pitch flat cable can be used.
- Accessories available.
- Interface standards for SCSI, Centronics, HPIB, GPIP, IEEE 488.

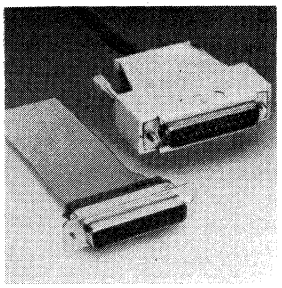
2 ROW IDC TRANSITION CONNECTORS
MODEL FCN-750



FEATURES

The Model 750 connector is slim—only 7 mm (0.275 in.) high and wide—and takes up very little space. The pins are in a 2.54 mm (0.100 in.) grid. It can be changed from a two-piece type connector to a direct solder dip connection without changing the PC board, because the mounting hole layout is the same as the Model 700 connector. And the series offers 10 to 60 contacts like the Model 700 connector.

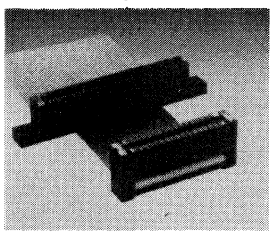
D-SUB CONNECTORS
MODEL FCN-770/FCN-670



FEATURES

- The 1.27 mm (0.050 in.) pitch flat cable can be used.
- The connectors are matable with MIL specifications D-type connectors.
- Fujitsu-developed highly reliable U-contracts are used.
- Molded and metalized (plated) holders are available.
- UL-recognized (94V-0) insulation material is used.
- RS232, 447, 449.

IDC CARD EDGE CONNECTORS
MODEL FCN-760, FCN-600



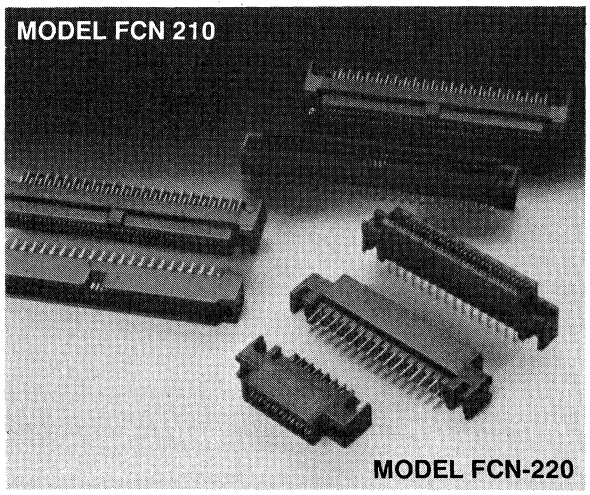
FEATURES

Model 760 connectors are card-edge connectors which meet conventional PC boards 1.6 mm (0.063 in.) thick with 2.54 mm (0.100 in.) pitch, and also connect to flat cables with 1.27 mm (0.05 in.) pitch. Contacts use highly reliable bifurcated contacts to assure stable connection with PC boards. A wide variety of contact numbers and three types of mounting ears are available for different needs. A closed-end cover is also available for convenience.

FUJITSU

CONNECTORS

BOARD TO BOARD & I/O CONNECTORS
CARD EDGE CONNECTORS



FEATURES

- 1.27 mm (0.05 in) pitch contact arrangement in two rows enables high-density mounting.
- They can be used for any type of connection between boards.
- The card-edge connectors can accommodate double-sided independent PC boards of 1.6 mm (0.063 in.) in thickness.
- Terminals are spaced in a four-row zigzag array (1.27 mm (0.05 in.) x 1.905 mm (0.075 in)) for easy PC board design.
- Insulation is UL-approved (94V-0), and is cleanable.

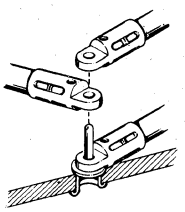
9W WIRE TERMINATION SYSTEM



Design Features

SOLDER-WICKING BARRIER

The design of HIRAM JONES 9W Wire Termination Systems provides a solder-wicking barrier, assuring flexibility of the wire and thus minimizing wire failures due to fatigue.

Wires are inserted in the 9W Crimp Terminals and crimped in place. Full engagement of the wire is determined by means of the inspection hole provided in each crimp terminal. The 9W Crimp Terminals are then attached to their mating Terminal Posts and soldered in place.

The entire termination is made without application of solder to the wire itself. It is, therefore, impossible for solder to "wick" up the wire.

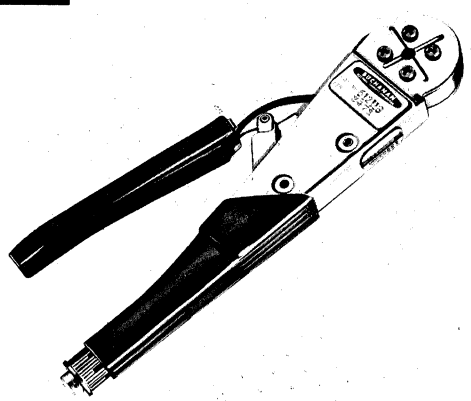
EQUIPMENT SERVICEABILITY

HIRAM JONES 9W Wire Termination System provides all the advantages of a hard wired system without the disadvantages of foreshortening of the service loop when disconnection and reconnection is required. The ease with which connections are made is a feature which is particularly advantageous in systems where connectors are undesirable, yet assemblies or sub-assemblies must be disconnected from time to time for service or replacement. To disconnect HIRAM JONES 9W Crimp Terminals, simply heat and lift off the mating terminal post. Reconnect by resoldering the 9W Crimp Terminals to the terminal post. Neither the mechanical nor electrical joint is affected by repeated removal and resoldering.

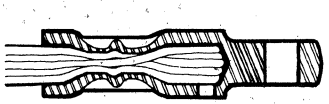
Increased Production Efficiency

By permitting pre-assembly of wires by unskilled operators, HIRAM JONES 9W Wire Termination Systems reduce production costs. Wires may be cut to length, stripped, and the 9W Crimp Terminals crimped in place. Final assembly consists of simply laying the pre-assembled Crimp Terminal on its mating terminal post and soldering in place.

9W MINIATURE MICROCRIMP TOOL



CROSS-SECTION OCTADENT CONFIGURATION



The 9W Miniature Microcrimp Tool (Buchanan No. 612118) is cycle-controlled to assure crimping to the selected depth. Once the crimping operation is started, the tool cannot be opened without completing its cycle.

9W LOCATORS — Specially designed locators are available for each of HIRAM JONES 9W Crimp Terminals. The use of one 9W Miniature Microcrimp Tool and the custom-designed 9W Locators is recommended to guarantee the precise crimp depth setting for each Crimp Terminal. When ordering, specify part number — i.e., 9W-206 Locator.

OCTADENT CRIMP — The 9W Miniature Microcrimp Tool produces an octadent configuration which provides uniform displacement of wire and crimp terminal material. The wire strands and the crimp terminal material are formed together in a solid mass with little or no reduction of the mil area of the wire strands.

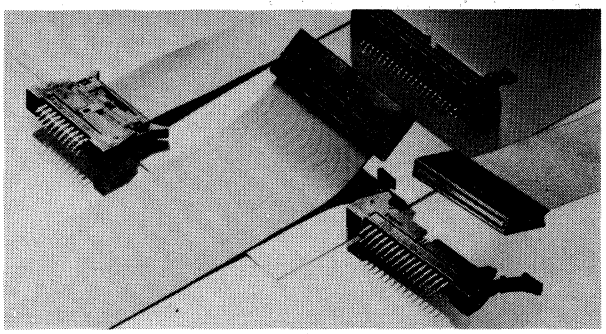
Hirose Electric (USA) Inc. offers the world's second largest line of electronic connectors, including circular, rectangular, telephone modular, coaxial, printed circuit type, IDC, IC sockets, microwave, fiber optic and other miniature types of connectors.

HIF6H Mini-Flex™ Ribbon Connector (For 0.025 ribbon cable)



Hirose's new HIF6H series Mini-Flex™ miniature connector joins the new HIF6 family of miniature connectors.

The HIF6H connector has an 0.050″ (1.27mm) center mating face and terminates to 0.025″ (0.635mm) flat ribbon cable.

This new connector allows pin #1 to pin #1 and reverse termination. Daisy chain (bus line) connections are possible with the use of a special cover.

Use of 0.025″ ribbon cable limits overall weight and reduces space needed for cable. Available circuits are 34, 40, 50, 60, 80, and 100. Mating latching header series is HIFH6. HIF6H sockets will also mate to HIF6A+(B) series box pin headers.

Typical high density applications include medical equipment, hand-held instrumentation, robotics, computer peripherals, office equipment, lap-top computers test and measurement equipment.

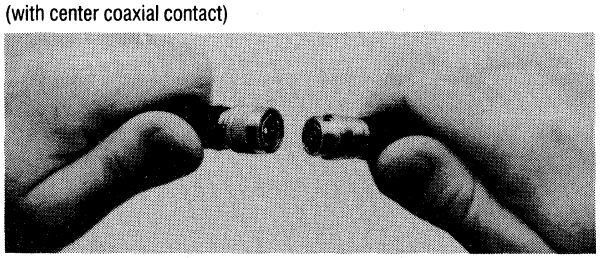
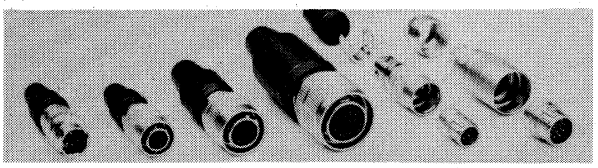
HR10 Series Snap-Lok™ Circular Connectors

(with center coaxial contact)





The HR10B is another step in the evolution of the HR10 Snap-Lok™ circular connector series while maintaining all the advantages of the HR10.

The HR10B offers a truly unique matched impedance co-ax center contact surrounded by 10 signal contacts. This is packaged in Hirose's standard size 10 shell. By keeping the connector compact, Hirose has not lost sight of the needs and demands for miniaturization and high density. When using the HR10B, you will appreciate how easy it is to handle. The connector is very well balanced and it is a snap to use its easy push-pull coupling mechanism.

With three shell sizes (7mm, 10mm and 13mm) and insert arrangements from 4 to 20 contacts including the newest HR10B in 10mm shell (with 10 signal lines and 50 ohm matched impedance coaxial), there is no problem finding an HR10 Snap-Lok™ circular connector to fit your needs.

Rugged and reliable, HR10 series connectors provide rapid error free mating even under the most adverse conditions.

The HR10B is a very versatile connector. It can be used in any type of electronic equipment where high reliability and high density are needed along with the added feature of the co-ax contact.

Typical applications are: computer, computer peripherals, medical equipment, audio equipment, video equipment, measuring equipment, test equipment and so on.

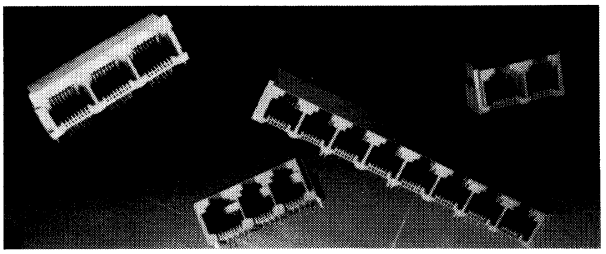
Hirose Modular Gang-Jack Connectors



Hirose has expanded its line of two-, three-, and four-position auto insertable modular Gang Jack connectors with the introduction of four new multi-cavity connectors.

The new Gang Jacks are TM 5RQ-1414 (one 8-contact and one 6-contact), TM 5RQ-2020 (two 6's and one 8-contact), TM 5RSA-2424 with three 8-contact positions and the TM5RJ1-4848, with eight 6-contact positions.

Hirose's side and top entry Gang Jacks offer the convenience and cost savings of a modular connection system in dual, triple, quad and larger packages.

Ideal for OEM manufacturing, Gang Jacks are widely used in designs for modems, phone answering devices, dictation machines, test instruments and office automation products.

Hirose's innovative 'ganged' design aids in inventory control by eliminating the need to stock more than one connector per installation and permits easy PCB loading either automatically or by hand.

Metal PCB "Lok-Tabs" assure a firm hold between connector and board prior to and during wave soldering operations. These unique tabs help form a "solder-rivet" which bonds the Jack and board.

Hirose Gang Jacks feature ABS insulator, suitable for wave soldering and phosphor bronze round terminals with 1.0 microns of gold plating. The low profile Gang Jack is ideal for trimline designs and is available for side entry and top entry mating. A rectangular shape simplifies automatic insertion and the Gang Jack is supplied in a popular grey color with optional colors available.

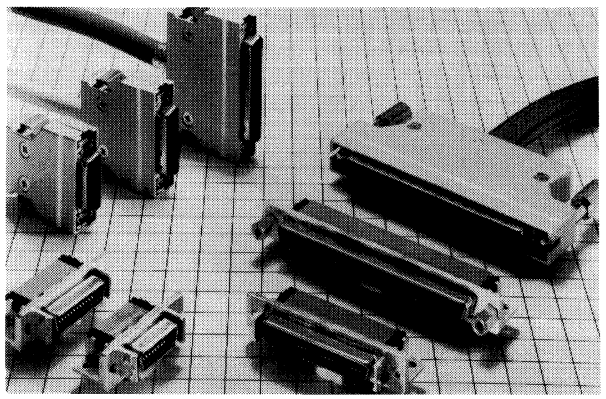
MINIATURE DX SERIES I/O CONNECTORS

(0.050 center Mating Face)



Hirose Electric's new miniature bellows contact connector series is currently available in 20, 28, 36, 50, 80 and 100-position shells. Future connectors include 60 to 68 position inserts.

The new 1.27mm (0.050") I/O connector, the "DX",™ incorporates bellows, or "ribbon" type contacts to eliminate problems encountered with other miniature connector designs using pin and socket configurations.

The new "DX"™ design provides positive locking, precise coupling, anti-scooping terminal protection and EMI shielding in a compact and rugged package. Using IDC termination to AWG #28 or #30 wires, this new series offers flexibility of using ribbon or discrete wire cable.

The unique Hirose shell design assures first make/last break gounding and offers complete protection from ESD, to the exposed terminals on the board side, when the connector is unmated. Positive locking is accomplished through the use of an integral "One-Touch" mechanism to assure repeated quick and effortless closures without damage to the lock or the terminals.

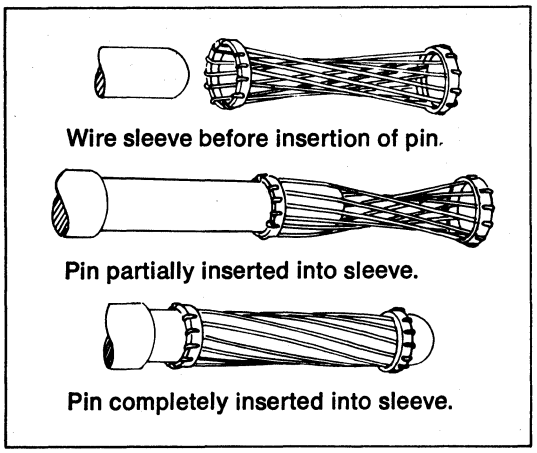
Hypertac® LOW INSERTION FORCE CONNECTORS



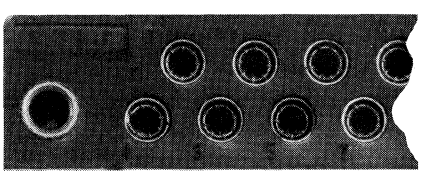
Hypertac® (HYPERboloid conTACt) is an advanced design that satisfies performance requirements previously considered impossible. Radically different in concept (principle is shown in the drawing), it is used in connectors having the highest performance requirements. The distinguishing feature of the Hypertac® socket is the hyperboloid-shaped sleeve formed by wires strung at an angle to the socket's axis. When the pin is inserted into this sleeve, the wires stretch to accommodate it. In so doing they wrap themselves around the pin providing a number of linear contact paths. This superior mating principle offers many advantages:

Lower Contact Resistance: Contact resistance is largely a function of contact area and surface condition. The multiple line contacts in the Hypertac® provide far greater contact area than other contacts of comparable size. The positive wiping action of the wires insures a clean and polished contact surface. Tests have shown Hypertacs® have about ½ the resistance of conventional contact designs.

Higher Current Ratings: The design parameters of the Hypertac® (e.g., the number, diameter, and angle of the wires) may be modified for any requirement. For example, the number of wires (no less than 5) can be increased so the contact area is distributed over a larger surface of the mating pin. Thus, the high current carried by each wire because of its intimate line contact, can be multiplied many times. At the same time the lower resistance reduces heat buildup. Therefore, Hypertacs® are able to handle far greater currents in smaller contact assemblies without the detrimental effects of high temperature.

Lower Insertion-Extraction Forces: Complete encirclement of the pin, along with greater contact area, make high contact forces unnecessary. The spring rate and resultant stress are therefore very low. The smooth insertion-extraction force is so low that even our 700 pin connectors can be easily disconnected without jack screws.

Less Wear and Longer Life: Reduced contact pressure also means a lower rate of wear. The taut wires having a small deflection relative to their span insure constant pressure, voltage drop and current ratings. Hypertacs® have a life of over 100,000 insertion-extraction cycles with almost no degradation in performance. Test pins with 50 micro inches gold plating had no base metal exposed after 8000 cycles (MIL-STD requires only 500 cycles for the same plating thickness).



Greater Reliability: The contact redundancy of multiple wires wrapped around the pin insures the ultimate in contact integrity. Elasticity of the wires also enables the socket to accommodate bent or misaligned pins.

Exceptional Electrical Continuity Under Shock and Vibration: The low mass and resultant low inertia of the wires relative to their resilience enables them to follow the most abrupt or extreme excursions of the pin without loss of contact. Tests conducted over the entire frequency range showed no discontinuity even when measured as low as 8 nanoseconds at 50 g rms. Moreover, the contact area is not limited to a single plane. It extends 360° around the pin and is uniform over its entire length. The three dimensional symmetry of design guarantees electrical continuity regardless of the direction or intensity of external or inertial forces.

Higher Uniformity: Machined rather than stamped parts, simple contact surfaces and selective plating before assembly avoids the possibility of shadow effects, gradients or trapped residues which could affect performance. Excellent physical and performance uniformity is thereby assured within each unit as well as perfect repeatability from unit to unit.

Requirements for connectors are such, that no matter how many details are incorporated in a brochure or catalog, we cannot include all types and variations. We would be pleased to consider your particular requirements; simply furnish all pertinent data to our Customer Service Department.

LEMO's Family of Connectors

Introduction for Connector Specifiers

There are 4 variables you should identify in specifying a connector:

1. Number of contacts
2. AWG
3. Voltage and current
4. Cable jacket outer diameter (for collet)

The tables on the following pages present this information concisely.

FIRST: Find the tables for the connector family which interests you.

SECOND: On the table selected, locate the size which accommodates the 4 variables noted above.

THIRD: Locate the outer shell configuration after the insert tables. Other configurations may be available for special applications.

PLEASE NOTE: If you do not see what you need please ask us. LEMO is constantly developing new products; therefore, all available connectors could not be included in this reference.

SHELL MATERIALS

Shells are constructed of precision machined brass with a hard satin chrome plated finish assuring rugged housing for maximum safety and uniform mating. Black, green or yellow chrome plating optional.

Optional materials include stainless steel or aluminum alloy (anodized in 6 colors: blue, yellow, black, red, green and transparent).

LEMO's lightweight Plastic Series of connectors are made of polysulfone PSU (MIL-P-461/20 MR). These connectors can be autoclaved.

Voltage Test Procedure—

PROCEDURE FOR DETERMINING TEST VOLTAGES AND WORKING VOLTAGES FOR LEMO CONNECTORS:

Test Voltage: Test voltages are determined by taking an average of the points at which arcing occurred and reducing it by 1/3.

Working Voltage: Working voltages are determined by taking test voltages and reducing them further by 2/3.

For high-voltage connectors, IEC publication 130-1 § 14.5 b) applies:

$$\text{Working voltage} = \frac{\text{Test voltage}}{1{,}5}$$

LEMO guarantees the proper functioning of the connector at working voltages.

Although this may appear quite conservative, it is in keeping with LEMO's insistence on assuring proper functioning and maintenance of high-quality standards.

Current ratings noted are per contact.

eem MINIGLOSSARY CONNECTORS

Connector terminology is often quite confusing. This confusion starts with the very names of connectors. The name of a connector may derive from its shape, application, type of conductor or even method of termination.

Shape—Circular, cylindrical, and rectangular.

Electrical application—High voltage, RF, microwave, input/output, etc.

Mechanical application—Printed circuit, rack & panel, cable, etc.

Conductor type—Coaxial, flat cable, ribbon cable, flex circuit, etc.

Termination method—Wirewrap, soldercup, solderless, etc.

Hardware such as clamps, hoods, and adapters are frequently used to convert cable connectors to rack and panel types. This adds to the name confusion. A very common telephone connector, for example (the "C" type) got its name from the model number of the original maker.

Contact: The part(s) of the connector that actually provides circuit continuity between its two sections—the parts which are normally mated. The back end of the connector should properly be called the *termination*. This is the point where the wires or PC board is attached to the connector.

Contact alignments: Often called *contact float*. Describes the amount of allowable contact movement within the connector body. Permits self-alignment.

Male vs. female: In the U.S. this describes the contact construction. In Europe this term is more often used to describe the outer shell mating action which may be the reverse of the contacts.

Closed entry: A female contact which prevents entry of a male contact larger than a specific size.

Open entry: A female contact designed for a specific size of male contact but which will allow entry of larger male contacts by spring action.

Hermaphrodite: Contacts or connector bodies which are the same configuration. Male/female designations do not apply. Bodies usually have some mechanical means for maintaining polarity.

Hermetic seal: Glass-to-metal seals at terminations. Often used improperly to describe vacuum-tight seals.

Waterproof seal: May or may not be truly *waterproof*. May prevent easy entrance of casual water by means of a rubber or other boot.

Printed circuit connector: Connectors which are used in conjunction with printed circuit boards. There are two distinctly different styles.

Edgeboard. May be called *edge* or *card*. The printed circuit (PC) board edge enters the connector.

Two-piece: One part of the connecting pair is physically attached to the PC board itself. The other part is attached to something else such as a cable or a motherboard.

Readout: Describes the arrangement at the terminating edge of a PC board. May be single or double. A double readout PC board has termination strips on each side not usually interconnected.

Ribbon connectors: A type of connector which allows flat "ribbon" cable to be attached to a round or rectangular connector but also used interchangeably for flat connectors to flat cable.

Ribbon contact connector: Describes the contacts in a rectangular connector which have a self-wiping mating action. Not the same as ribbon connector.

Solderless terminal: Any style of termination which does not require solder for a permanent connection. See *crimp* and *insulation displacement*.

Crimp termination: A stripped wire is inserted into a barrel or trough which is then crimped to the conductor with a suitable tool.

Insulation displacement: Unstripped insulated wire is fitted into a channel containing metal teeth which are forced through the insulation to make contact with the conductor.

Service rating: The maximum rated voltage and/or current which may be applied continuously. May be called *working voltage*. Can be confused with the term used to describe how many times a connector may be mated and separated.

Withstanding voltage: Also called *test voltage*. The voltage a connector must withstand for one minute without breakdown. Applied between connectors and between connectors and shell and any grounding devices of the connector.

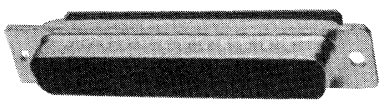
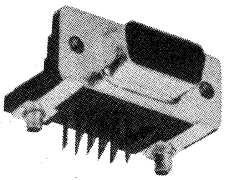
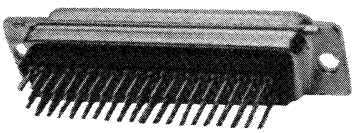
HIGH DENSITY "D" CONNECTORS







Our DH Series connectors are designed to replace D-Subminiature connectors in your designs.

Consider these advantages:

- Average 68% increase in throughput compared to D-Subs of equal sizes.
- Standard D-Sub shell dimensions eliminate costly retooling of panel openings, etc.
- Use standard D-Sub hoods and hardware.

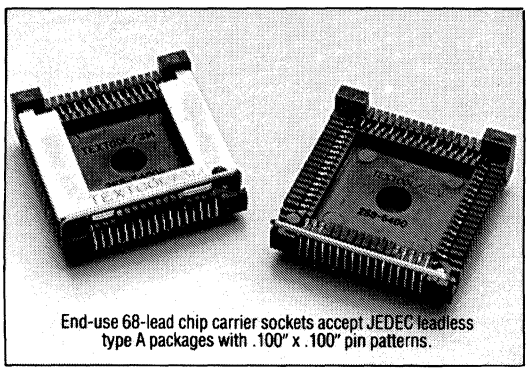
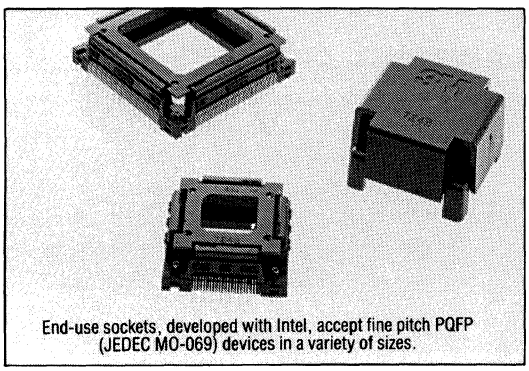
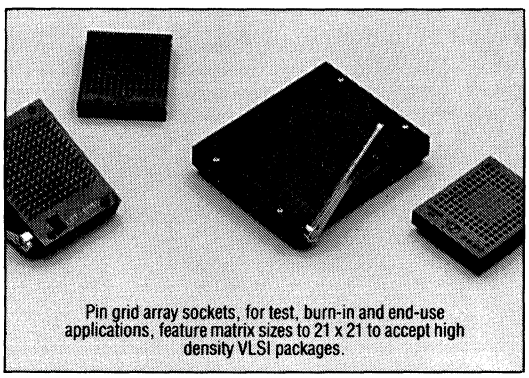
For test, burn-in, production sockets and IC carriers, tough customers turn to 3M.



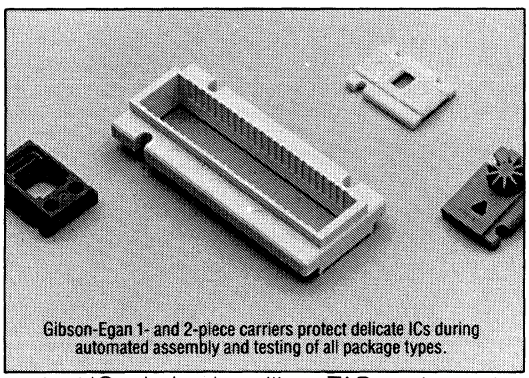
End-use 68-lead chip carrier sockets accept JEDEC leadless type A packages with .100" x .100" pin patterns.



End-use sockets, developed with Intel, accept fine pitch PQFP (JEDEC MO-069) devices in a variety of sizes.



Pin grid array sockets, for test, burn-in and end-use applications, feature matrix sizes to 21 x 21 to accept high density VLSI packages.



Gibson-Egan 1- and 2-piece carriers protect delicate ICs during automated assembly and testing of all package types.

3M makes it easy to get the right IC sockets for your needs with our selection of Textool™ designs for test, burn-in and end-use applications. Sockets accept PQFP, chip carrier, flat pack, pin grid array, DIP and discrete components in a variety of body, contact and plating materials. Our PLCC Quick Lock burn-in sockets maximize board real estate and speed loading and unloading.

ZIF DIP™ end-use DIP sockets are designed for applications requiring field replacement or reprogramming of packages: PROM, EPROM, mobile telephones, PABX equipment, programmable auto horns, robotics and more.

The patented ZIP™ (Zero Insertion Pressure) feature on our pin grid array and ZIF DIP sockets protects expensive leads from damage. The low profile and durable leads of our chip carrier sockets make them ideal for high volume production applications.

We also offer IC carriers for all package types useful in handling and automated assembly and testing. Special antistatic materials protect ICs during handling. TAB carrier and socket configurations are also available.

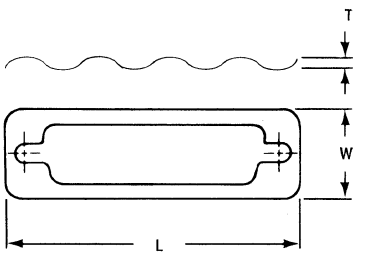
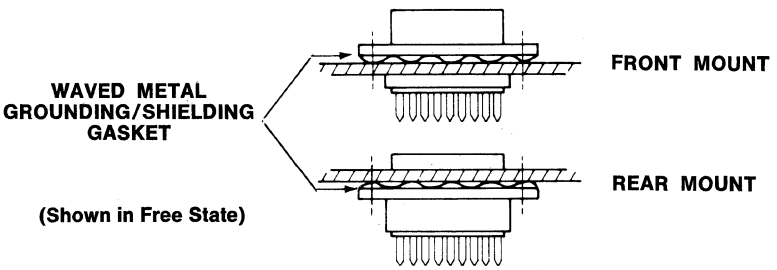
Mounting Considerations Waved Metal Gaskets...For Complete EMI Protection

Proper mounting of any EMI filter — including the EMI filtered D Subminiature — is critical to the achievement of electromagnetic compatibility. The mounting surface for grounding the connector must be free from paint or any other insulating material. The sketches below indicate the use of one of Spectrum's EMI gaskets to fill any tolerance gaps and adjust for irregularities in the flatness of the mounting surface.





Shell Size	Mounting Configuration	L	W	T Free State	T Compressed	Part No.
25	Front Pin - Socket	2.088 (53,04)	.600 (15,24)	.030 (0,76)	.005 (0,13)	572019-00102-70
	Rear - Pin					
	Rear - Socket	2.088 (53,04)	.600 (15,24)	.030 (0,76)	.005 (0,13)	572019-00107-70

Spectrum EMI Filtered D Subminiature...Unique

Spectrum D subminiature connectors feature a unique ground plane to effectively block bulkhead leakage of EMI. The design also provides line to line isolation separation to limit cross talk (line to line mutual coupling) to an absolute minimum. Another, and a most important feature, is the coaxial spring contact that provides proper electrical grounding when mating one connector to another connector.

MICRO-GATOR CLIP (5 Amp.)
(Smallest Insulated Clip Ever Made)

U.S. Patent No. 2,762,028 Trademark Reg.

Micro-Gator

Micro-Gator with Insulator

The alligator clip with the microscopic tip! New design features rivet hinge for greater strength. This is the alligator clip you now can use where no other clip will do . . . on printed circuits, in tight spots and on tiny terminals too crowded for anything but its microscopic tip. Including separate skin-tight insulator, the tip is no bigger than the head of a pin! Yet the Micro-gator has ample thumb grip, and plenty of bite to stand up straight on the smallest terminals. Ample 7/32" (.55) jaw spread. 1-3/32" (2.78) long. Solder connection. Skin-tight flexible vinyl insulator (sold separately) has "lip-action" tip slot so that jaws stay covered whether open or closed.

No. 34 — Steel, cadmium plated
No. 34-C — Solid Copper
No. 36 — **Insulator for 34 and 34-C**

CABLE ASSEMBLIES

CAI applies innovative technical engineering concepts to the production of voice, data and power cable assemblies. We also add value to any cable transferring light or energy through non-mechanical means with thermoplastic moldings and coatings, such as:

- Transfer Molding
- Injection Molding
- Insert Molding
- Shuttle Molding
- Resin Dipping
- Environmental Sealing

CAI's abilities to incorporate plastic molding materials in cable assemblies is limited only by the availability of the material. We are experienced in handling all common (and most special) materials, and in any color you choose.

As well as being equipped to handle high-volume orders, we also are an ideal source for your prototype units and sample runs, without the need for long-term committments. Further, we handle short runs of out-of-production cable assemblies.

WHAT ALL THIS MEANS TO YOU:
Because of all the things we can do for you, there's hardly anything you need to do except call us. You don't have to hire skilled labor to produce Zero-defect crimping, soldering, splicing and similar work that puts a new meaning on the term "labor intensive." You don't have to go through the expensive bell-curve of on-the-job training. And you avoid putting your Purchasing Agents through a wringer trying to source each part, checking item-by-item with Engineering to insure compatability. In short, you keep your bottom line where it's supposed to be.

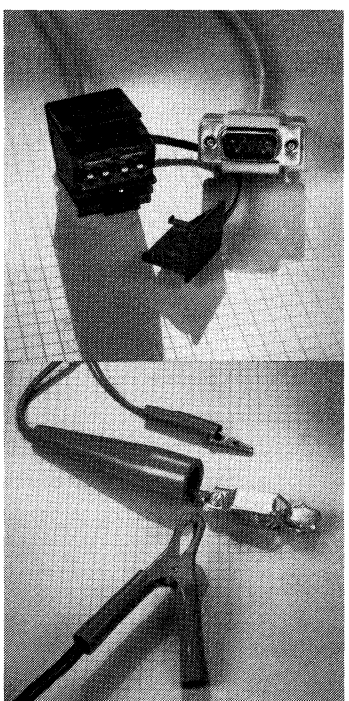
QUALITY ASSURANCE:
Our Statistical Process Control system starts with incoming raw material and extends through everything else we do, including 100% testing and inspection. Every cable is both static and dynamic tested on CAI's computerized, state-of-the-art test equipment. Our SPC system takes the worry out of how well cable assemblies operate on the equipment.

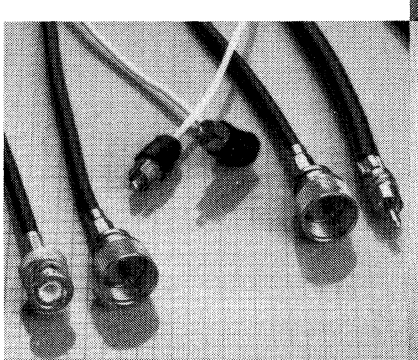
MULTI-DIAMETER CRIMPING:
With CAI's versatile crimping equipment, we offer a wide range of wire and cable crimped to an even greater range of electronic connectors. We have the flexibility to choose the best technique for the job to be done, from sophisticated machine terminators to simple hand tools, using 4/0 to 40AWG, fiber optics, ribbon, flat, round, etc.

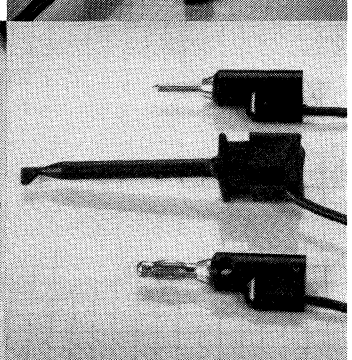
AUTOMATIC WIRE CUTTING AND STRIPPING MACHINERY:
CAI's wire cutting/stripping machines produce precisely-measured, cut and stripped wire in many lengths. Our high-speed machines handle single and twin conductor wire. They can be quickly adapted to work with virtually any standard or non-standard wire end arrangement.

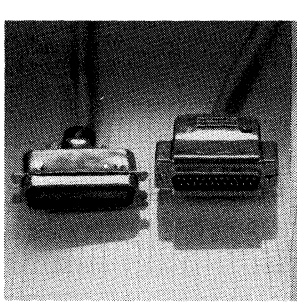
LABELING AND PACKAGING:
We are geared to handle special labeling and imprinting, from industrial bulk quantities to retail packs. Talk to us about your requirements; you'll be pleasantly surprised to hear how practical this service can be for you.

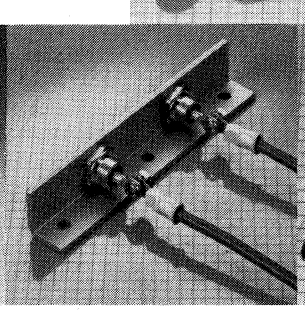
VALUE FOR YOUR MONEY:
We are well aware of how price sensitive this business is. We also know full well how reputation-damaging and just plain expensive cable failure can be when it's on your unit. Because we know both sides of this coin, we make sure you get the quality level you must have without a penalty in price.

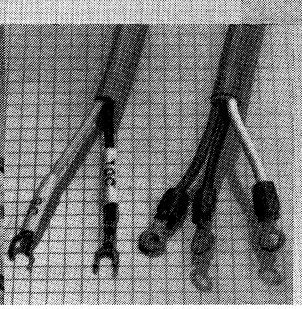


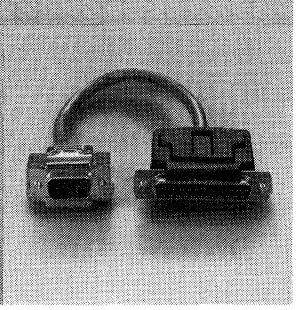












The Industry Performance Standard: Connectors from Multi-Contact.

Outstanding Design. Experienced Manufacturing. Guaranteed Safety. Excellent Quality. Superior Service.

From design to manufacturing, Multi-Contact connectors are produced to satisfy the highest industry standards of performance and reliability.

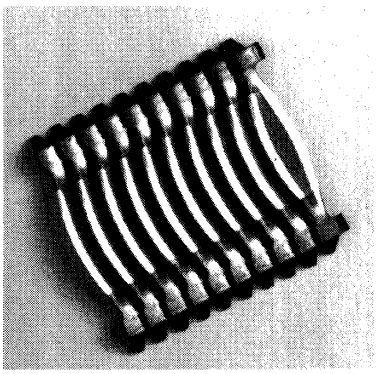
Sophisticated R&D efforts, in-house testing, and stringent quality controls have one simple, critical result: State-of-the-industry connector technology.

Multi-Contact connectors are made from solid brass (CuZn40Pb2), first nickel plated, then sealed with either a hard gold or hard silver plating.

MC-MULTILAM™ connectors exemplify Multi-Contact's innovative technology and commitment to quality. The precision, multiple louvered contact interface assures optimum contact performance. The MC-MULTILAM™ contact band is made from beryllium-copper, precision-stamped and tempered, then hard gold- or hard silver-plated.

MC-MULTILAM™ connectors can be used for unlimited applications due to their design flexibility and advanced features:

- High contact pressure—yet low insertion force
- High specific current capacity
- Lowest contact resistance
- Low voltage drop—minimal heat rise
- Mechanical strength—tens of thousands of mating operation
- Precious metal plating—excellent corrosion protection, even in aggressive and hostile environments



The MC-MULTILAM™ System...

...efficient solutions for all applications.

OXLEY TEST POINTS

TEST IT!
with KINKY PIN TEST POINTS
Reliably. Efficiently. Economically.

Designed for plated thru hole applications, Oxley's compliant Kinky Pin retention mechanism allows wide hole tolerance. The precision turned pin head prevents a test probe from being dislodged and is available in two lengths for low profile or high density applications. Easily wave or hand soldered into place.

The **OXLEY KINKY PIN test** point connector is a new compliant pin for use in plated through hole (PTH) printed circuit boards.

Intended to be used as a test equipment connection point, the precision turned pin head prevents a test probe being dislodged.

An ingenious kinked pin is utilized as a compliant retention mechanism, designed to prevent damage to through-plated holes during insertion while providing sufficient retention for wave or hand soldering.

NOMOGRAPH VOLTAGE DROP

NOMOGRAPH OF VOLTAGE DROP ACROSS LOAD SUPPLY LEADS
(as a function of wire size and load current)

THIS NOMOGRAPH CAN BE USED TO FIND:

Maximum current carrying capacity recommended for any standard wire size.*

1) With a straight edge, connect from the wire size on Scale 2 to the point "A" on Scale 3.
2) Read I_{max} on Scale 1.

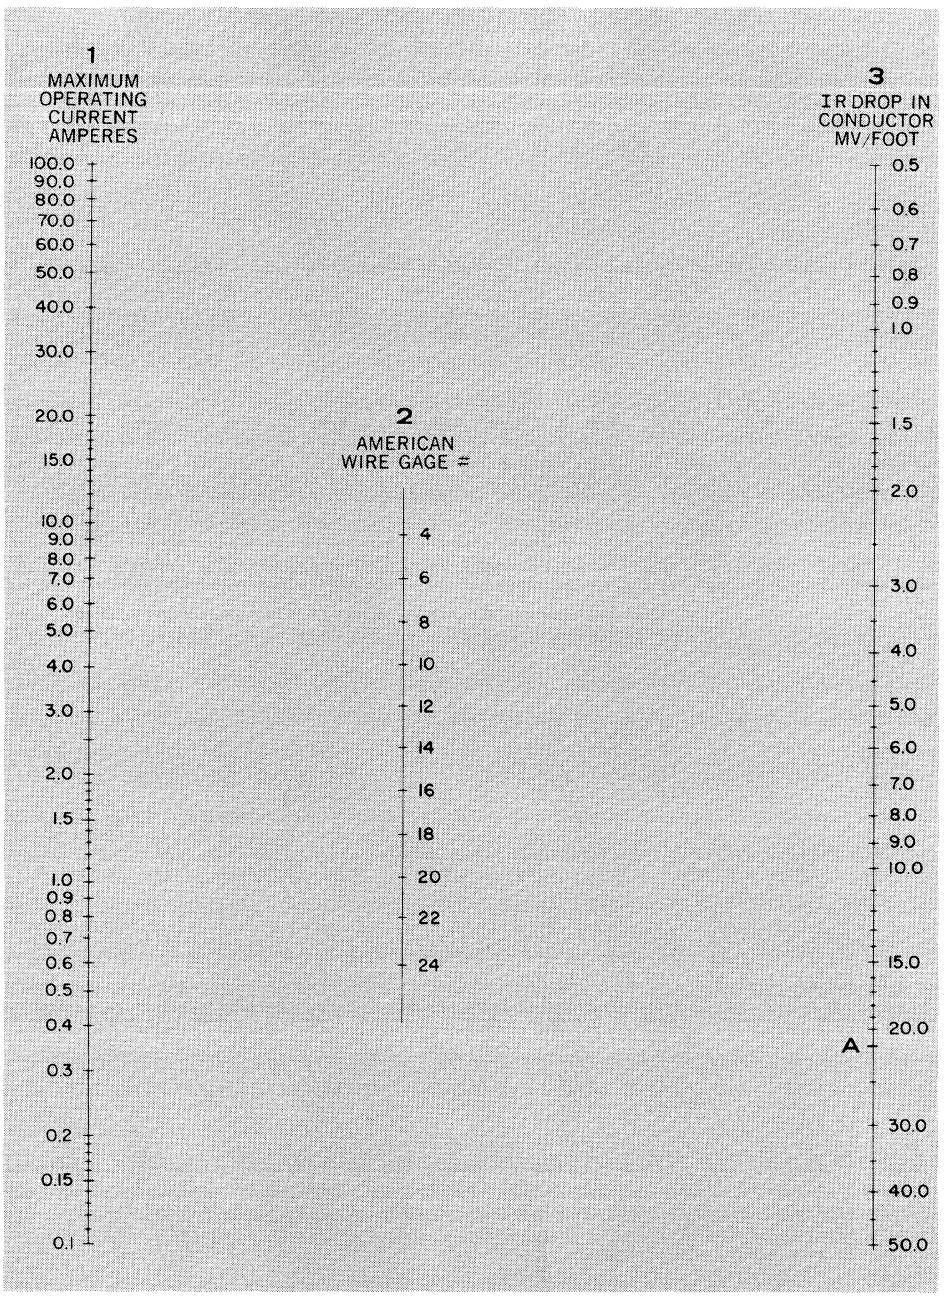
Voltage drop in millivolts per foot for known wire size and operating current.

1) With a straight edge, connect the known current on Scale 1 and the wire size on Scale 2.
2) Read voltage drop on Scale 3.

Wire size required for known operating current and known maximum tolerable voltage drop across supply leads.

1) Determine maximum tolerable drop in millivolts **per foot** of lead (sum of positive and negative leads).
2) Connect the value on Scale 3 (as determined in step 1) to the known current on Scale 1.
3) Read wire size on Scale 2.

* *Based on an arbitrary minimum 500 circular mils per ampere. High-temperature class insulation will safely allow higher currents.*

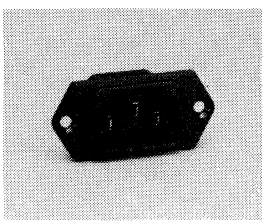


NOTE: A voltage stabilized Power Supply controls the voltage across its output terminals. Hence, the wire conductors used to connect the load must be considered as part of the load. At high load currents, the voltage drop across the supply leads may appreciably degrade stablization at the load. Kepco models equipped with the *remote error sensing* feature can automatically compensate for voltage drops of up to 500 mV across each load supply lead.

IEC 320 Power Inlets & Connectors

65°C 120°C

The IEC 320 power inlet is the most commonly used means of connecting a detachable cordset to electrical or electronic equipment that consumes up to 16 amps at 250 volts or less. This standard is used in Europe, North America and throughout the industrialized world. By designing an IEC 320 power inlet into a product, the manufacturer can attach the correct international cordset (e.g., a cordset with a British, Australian, Continental European or North American NEMA plug) just prior to shipment. Note that European voltages and frequencies are typically 220-240VAC (50Hz); see opposite page for modules that combine an IEC 320 power inlet and voltage selector. See following pages for accessory power system based on IEC 320.



#8843.FSGA.40.60: with 6.3 mm (1/4") solder/Q.D. tabs

International Multifunction Power Modules

65°C

Power modules aid in configuring a product with the correct cordset, voltage, and fusing for international or North American markets, and can also save on space, assembly costs, and components management because several functions are combined in one unit. A power module can also make a product safer; because it is possible to interlock the power entry connector with access to a fuseholder or voltage selector, the equipment user ***must*** remove the power cord before changing a fuse or adjusting a voltage selector.

Interpower™ International Socket Strips

The International Socket Strip incorporates seven of the main overseas socket standards in one device. Connect it to your own power source in burn-in racks or test labs where products with international cords or cordsets are being prepared for export; or, use it for receiving inspection on international cords and cordsets.

Installation to Your Power Source: The International Socket Strip is equipped with two unterminated power cords—one for connection to your 220VAC/ 50Hz power source, the other to a 240VAC/ 50Hz power source. The conductor size is 1.5mm² (slightly larger than 16 AWG which is 1.23mm²). Each circuit is rated at 16 amps maximum for all of the sockets combined. Each cord is 2.5 meters long and clearly marked as to voltage. The jacket and primary insulation are stripped and ready for installation to the appropriate power source. The primary insulation is color-coded in accordance with international standards: green/yellow=ground • brown=line • blue=neutral. Both table-mount and rack-mount models are usually available from stock in Santa Rosa, California.

See section 4050 for our International Power Source which converts standard North American input voltage of 120V/60Hz to output voltages of 0-250VAC at 47-63Hz or 47-500Hz.

MULTIMETER TEST LEAD KIT

Pomona Electronics' multimeter test lead kit, with maximum flexibility, allows the operator to change from a test probe to a Minigrabber® Test Clip, Alligator or spade lug configuration. Simply detach the probe from the test lead and attach the desired device.
Test leads feature heat resistant silicone wire. The unique sheathed banana plug on the test lead mates easily with the banana receptacles mounted on each device. This interconnection is held secure by dynamic friction created by dissimilar plastics. Once this force is overcome, the test lead can easily be removed.

Power Dynamics IEC Connectors have been submitted, tested and approved by most recognized National Testing Agencies. These prior approvals eliminate the necessity of a retesting program when submitted in equipment being evaluated by these same testing agencies.

Our IEC Connectors which conform to CEE-22 are accepted throughout the world for use in electrical equipment. Designers and manufacturers are offered maximum flexibility as PDI Connectors mate with all universally accepted CEE-22 Power Cords. PDI offers a complete selection of Power Cords. Equipment which incorporates PDI Connectors also offers the further advantage of shipping finished units with correct cord set, permitting immediate use without time consuming modifications on the part of the end customer.

**GENERAL NOTES ABOUT PRECICONTACT SOCKETS*
Low profile Precicontact sockets are designed to meet MIL-S-83734. All socket assembles (except Series LTO) feature four-leaf inner contact springs assembled into closed-entry, machined sockets that accept short IC leads. Inner contacts are BeCu, gold-over-nickel per MIL-S-45204, outer sleeves are brass, gold-over-nickel, or tin-plated. Standard insulator material is thermoplastic polyester, UL-rated 94V-0, except where noted. Contact design eliminates solder or flux wicking problems.

DIN CIRCULAR CONNECTORS

Preh circular DIN connectors are rugged, miniaturized connectors designed to provide reliable interconnections to peripheral equipment, test and measurement instrumentation, medical equipment, control devices, etc. Originally designed for audio applications they range from 3 to 8 contacts per connector at operating power up to 3A/34V. Preh connectors are available in nickel plated die cast zinc alloy bodies for applications requiring durability and also in plastic bodies where durability is not a problem. Insert material is molded phenolic. Female "tuning fork" type contacts are silver plated while male pins are tinned. Connectors and contacts can be custom plated to customer specification.

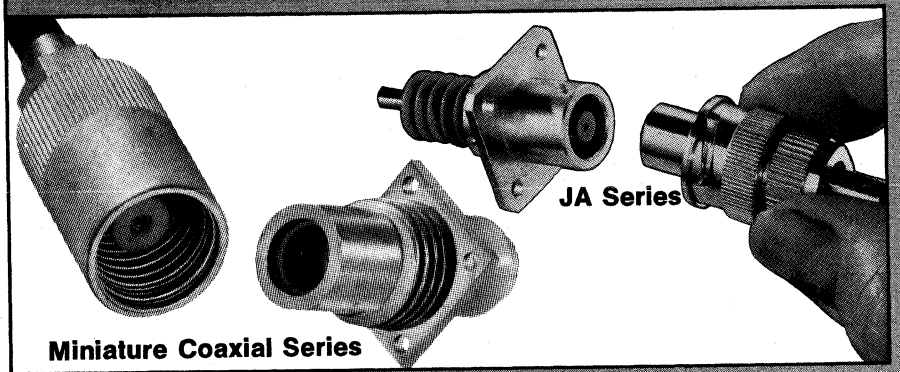
FOR YOUR COMMERCIAL, INDUSTRIAL OR MILITARY DESIGN NEEDS

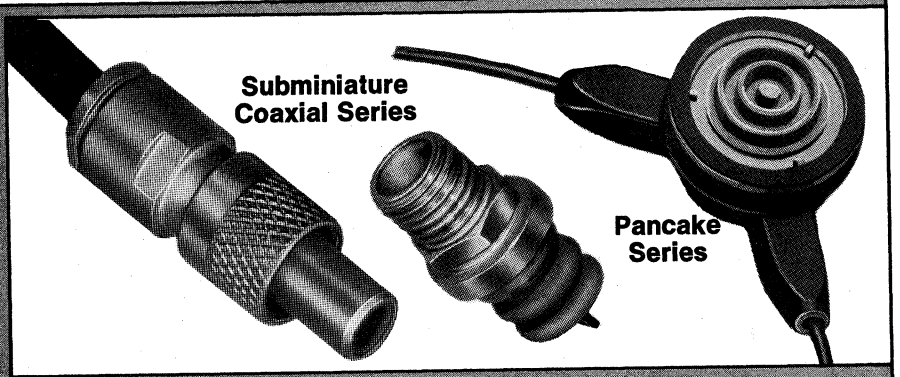


Rowe Miniature Coaxial Connectors and Cable Assemblies

Employ the same high-voltage design techniques as the coaxial series, but are much smaller in size for use in restricted spaces. Available in quick disconnect and screw couplings (the JA Series can be adapted to such standard type cables as RG 58 and RG 59).

Rowe Subminiature Coaxial Connectors and Cable Assemblies

Are ideally suited for use where space is at a premium. Employing the traditional Rowe high capability features, the subminiature sizes offer unusually high voltage operating capabilities, through 20 KV.



Rowe Low-Voltage, Molded-On Connectors and Cable Assemblies

For use in severe environments. We can mold your STD connectors to cable for an environmental seal and provide a molded strain relief. Our exclusive Insta-Change series was designed for factory, mining, nuclear and oil well use.

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

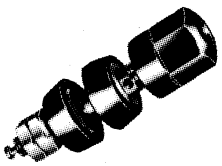
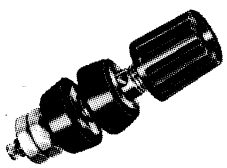
5-way® BINDING POSTS

5 WAYS TO CONNECT • GOLD-PLATED BRASS PARTS • RANGE OF COLORS



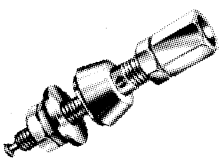
FLUTED NUT TYPES

Plastic parts of standard (not miniature) size types molded of Lexan polycarbonate resin; brass parts are gold-plated. Rated for 30 amperes, 1000 volts working. Available with #8-32 or #10-32 stud behind panel.



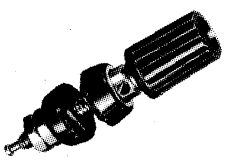
HEX NUT TYPES

Rated for 30 amperes, 1000 volts working. Brass parts gold-plated; plastic parts are of nylon compounded to meet military specifications MIL-P-20693A, Type IV. Available with #8-32 or #10-32 stud behind panel.



GROUNDING TYPE

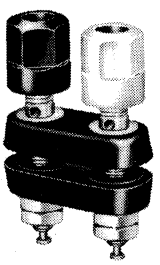
For making rapid connections to ground. Made of finely machined brass nickel-plated and polished. Panel grounding collar frozen to shaft has "D" type shoulder for locking in keyed panel hole. Has #10-32 stud behind panel.



MINIATURE TYPES

Fluted nut design. Rated for 15 amperes, 1000 volts working. Nylon parts meet military specification MIL-P-20693A, Type IV. Has #6-32 stud behind panel.

DOUBLE ASSEMBLY TYPES



For instrument and equipment panels requiring binding posts mounted on 3/4" centers. Available in standard or miniature sizes. Construction and ratings same as for corresponding single types. Self-contained assembly makes mounting more accurate, faster and easier than two individual binding posts and gives maximum strength where connections are frequently made.

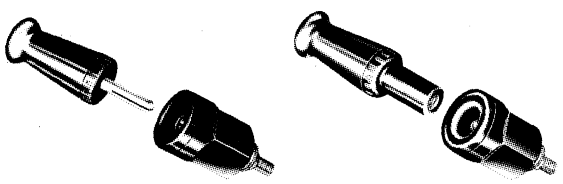
ELECTRICAL CONNECTORS



Nylon plastic parts; gold-plated brass current-carrying parts. Wiring connections to the same plug can be either soldered or solderless. Plug cable-fastening screws permit a wide range of cable sizes. Plug grips are of a simple, two-piece threaded construction for quick assembly. All receptacle plastic parts are molded of the same color to permit more rapid and accurate circuit identification front and back of panel when installed. The 25, 50 and 100 ampere types are listed by Underwriters' Laboratories, Inc. In red, black, white, blue, green or yellow.

5-way™

TEST PROBES

For test connections to PC boards and other electronic components. Design allows connections by hooking onto component leads or by plugging into Superior Electric 207146-001-JB terminals or others having 0.080" diameter receptacles. For plug-in, conductor holds firmly to inside of receptacle under spring tension. When used for hook-on, probe clamps to component lead or wire wrapping pin with approximately 16 oz. force. Conductor beryllium copper tempered to spring hardness. Insulating parts durable nylon plastic capable of withstanding 250°F without deforming. Available in red, black, white, blue, green or yellow.

CIRCULAR DIN CONNECTORS

Designed for low level circuitry, for unlimited use in computer, commercial, industrial, consumer and military applications. Exact replacements for plugs and receptacles, used on most foreign built recorders, radios and dictation equipment. Also used extensively for computer keyboard, I/O and peripheral applications. "Switchcraft/DIN" 2 to 8 contact connectors include male and female plugs and receptacles with bright nickel-plated barrels & plastic snap-on shells. Lock-ring coupling, silver plated contact pins for low contact resistance, contact friction coupling for low mechanical interference noise, exclusive "automatic" grounding and polarization provisions. Full line of receptacles offer thru panel, PC board and surface mounting. Positioning "Ground Key-Rib" or "Ground Contact" — electrically integral with the connector shell — is provided in each plug and receptacle (except those with plastic housing or shells) to ground or shield the connector shell. Right angle PC board mount for common ground use also available.

"Q-G" AUDIO CONNECTORS WITH COMPLETE GROUNDING PROVISIONS!

Switchcraft "Quick-Ground" connectors feature a separate "Ground-Terminal" electrically integral with connector shell. Ground continuity between mating plugs automatically accomplished through exclusive "Ground Contactors". Possible loss of insert screw is eliminated by new "Captive-Design" insert screw. Socket and pin assemblies utilize "wedge-action" to insure firm, reliable positioning in connector shell. Inserts are easily removable for wiring & soldering. High impact thermosetting plastic material insures long reliable insert assy. life. Female connectors have latch lock feature to hold connectors firmly together. Plugs and receptacle mechanically keyed for proper mating. "Q-G" (*) Series 3-, 4-, 5-, 6-, and 7-pin/contact connectors offer 4-, 5-, 6-, 7-, & 8-pin contact versatility when "Ground-Terminal" is used. Used interchangeably with Switchcraft QGP connectors (page 41): 3- and 4-contact (Amphenol 91-850 and Excellite 91-450 Series, and Cannon XLR-3, XLR-4): 5-contact (Cannon XLR-5 and Amphenol Excellite 91-450 Series).
Cord plug part no. suffix "L" indicates strain relief accepts cables from .25 in. (6.35 mm) to .328 in. (8.33 mm) dia.; other plugs accept cables up to .25 in. (6.35 mm) dia. (*) Number of insert contacts or pins must be specified to complete part number.
Part number with suffix "B" indicates cord plug with "Black-Velvet" black finish (minimizes glare and permits stable "through-connector" shielding). Suffix "D" indicates type with "FAS-DISCONNECT" detent feature. U.S. Patent 3,219,961; Canadian Patent No. 761,114 (June 13, 1967)

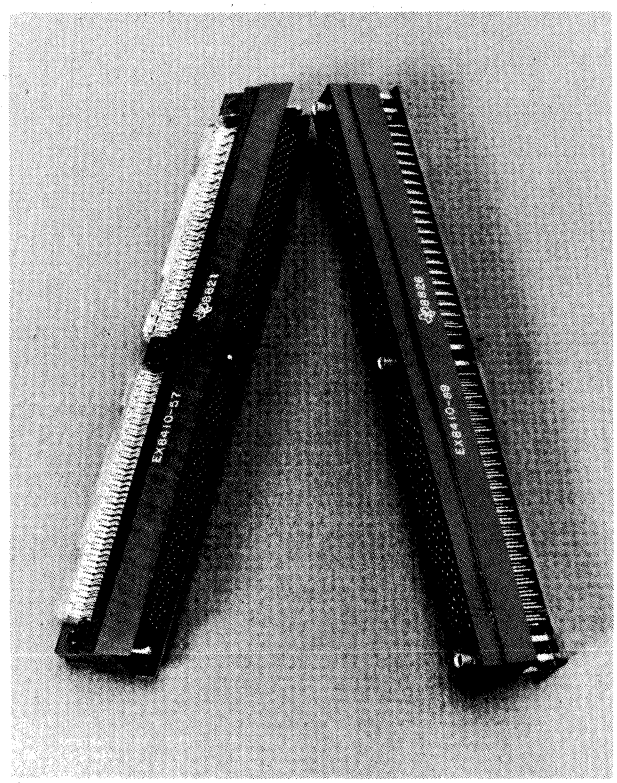
UHD, ULTRA HIGH DENSITY TWO-PIECE, SMT, MILITARY CONNECTOR

More programs have begun to use surface mount packaging techniques in order to save space and weight. The choice of connectors available to implement these designs is limited.

A major effort in the connector industry has been to develop a connector for the 3/4 ATR (size 6) line replaceable module (LRM).TI's Micro Electronics Packaging Department of the Defense Systems and Electronics Group and TI's Connector Systems Department have jointly developed the UHD family of surface mount connectors for LRM applications, The UHD connector is sized for the 3/4 ATR card. Optimum sizing provides a maximum of 344 contacts. The basic connector is of molded construction and is adaptable to fiber optic or coax contacts. It is designed to provide minimum card spacing where pin shielding is not required. A metal shell version is available. The uniquely designed motherboard (receptacle) connector utilizes an integral termination "organizer" and provides for plus or minus .020" lateral float with minimum force during the thermal clamping cycle. This insures intimate surface contact at the chassis to card interface. UHD production is fully available. Second sources are being secured at this time. The connector is available in half-length sizes with 172, 128, or 84 pins and full length sizes with 344, 256, or 168 pins.



DESIGN FEATURES

- 3 amp current rating.
- Maximum of 344 high reliability screw machine contacts.
- Selective loading for optimum flexibility.
- 2 oz. average mating force contacts.
- Full and half size versions.
- Stackable on .500 inch centers.
- Designed to meet MIL-C-55302 requirements.
- Standard MIL-C-55302 hardware for 1000 keying positions.
- Surface mount daughtercard with alignment tooling availability.
- Thru hole motherboard mounting with integral lead organizer.
- High performance Ryton insulator material.
- Compatible with vapor phase reflow (+230°C).
- .020" lateral adjustment capability.

ADDITONAL FEATURES

- Metal shells
- Interfacial seal
- Fiber optics
- Coax contacts

TWO-PIECE MILITARY CONNECTOR PRODUCTS .075" CENTERLINE X .0375" OFFSET STRAIGHT AND RIGHT ANGLE PLUGS, STRAIGHT RECEPTACLES

An increasing number of new programs are being designed which exceed the traditional .100" centerline product offerings. Also, mature programs are being redesigned which will require increased I/O capability in the same or less available space.

In order to meet the needs of today's designer, Texas Instruments has a new .075" centerline military connector series.

The wide selection of body styles, contact designs, assembly hardware, selective loading, and special variations available provides maximum flexibility.

The MIL-C 55302 qualification has begun and slash sheet approval is expected in mid-1989.

Samples, specifications, and design assistance are available now.

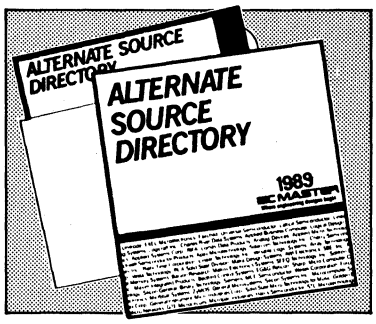
HEARST ENGINEERING SOFTWARE

ICMASD...IC Alternate Source Directory

If you've used the IC MASTER, you know what the Alternate Source Directory is. Engineers tell us that it's one of the most valuable sections of the Master. The Alternate Source Directory...ASD...is now available in floppy disk form.



The electronic ASD is FAST! Just ask a question and the answer pops up in a split second.

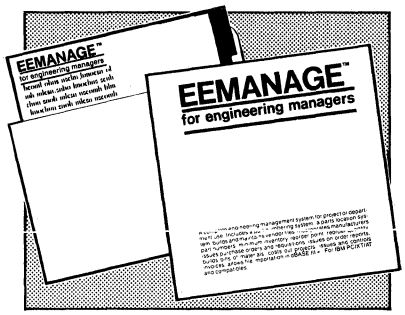
The electronic ASD is FLEXIBLE! You can add ICs and you can add comments.

You can add part numbers, prices, technical notes or anything else you like. You can customize the ASD to fit your needs and the needs of your company.

Order the Alternate Source Directory for your AT, XT or compatible. We'll send you two floppies and a very simple piece of printed documentation. Download the floppies and you're in business. All you need is a hard disk.

EEMANAGE...for engineering managers

Developed by the publishers of EEM/ Electronic Engineers Master, EEMANAGE is a software program designed to make life easier for engineers and engineering managers.



EEMANAGE does many things: 1. Develops Bills of Materials 2. Assigns Part Numbers logically 3. Manages Engineering Inventories 4. Issues Purchase Requisitions 5. Relieves Engineering Inventories 6. Manages a Parts Storage System 7. Issues Engineering Change Notices 8. Interfaces with dBaseIII+ Programs.

EEMANAGE is completely menu driven. It is simple to understand and operate. Any competent secretary can be up and running on EEMANAGE in minutes.

Order EEMANAGE for your AT, XT or compatible. We'll send you one floppy and brief, very user friendly documentation.

The basic price for ICMASD or EEMANAGE is $149.50* each and includes floppy disk(s) and complete program documentation.

Take the guesswork out of choosing which footprint pattern and enclosure cut-out to use for PCB connectors. With LOW PROFILE Female Connectors our footprint pattern and enclosure cut-out remains the same for all of our styles of connectors. The drawing above can be used for any of our connectors and the accompanying chart shows which solder post holes need to be drilled. Enclosure cut-out dimensions are also shown.

-Durability 500 minimum mating cycles
-Interchangable with Virginia Plastics DT Series Connectors

cem MINIGLOSSARY CONNECTORS

Connector terminology is often quite confusing. This confusion starts with the very names of connectors. The name of a connector may derive from its shape, application, type of conductor or even method of termination.

Shape—Circular, cylindrical, and rectangular.

Electrical application—High voltage, RF, microwave, input/output, etc.

Mechanical application—Printed circuit, rack & panel, cable, etc.

Conductor type—Coaxial, flat cable, ribbon cable, flex circuit, etc.

Termination method—Wirewrap, soldercup, solderless, etc.

Hardware such as clamps, hoods, and adapters are frequently used to convert cable connectors to rack and panel types. This adds to the name confusion. A very common telephone connector, for example (the "C" type) got its name from the model number of the original maker.

Contact: The part(s) of the connector that actually provides circuit continuity between its two sections—the parts which are normally mated. The back end of the connector should properly be called the *termination.* This is the point where the wires or PC board is attached to the connector.

Contact alignments: Often called *contact float.* Describes the amount of allowable contact movement within the connector body. Permits self-alignment.

Male vs. female: In the U.S. this describes the contact construction. In Europe this term is more often used to describe the outer shell mating action which may be the reverse of the contacts.

Closed entry: A female contact which prevents entry of a male contact larger than a specific size.

Open entry: A female contact designed for a specific size of male contact but which will allow entry of larger male contacts by spring action.

Hermaphrodite: Contacts or connector bodies which are the same configuration. Male/female designations do not apply. Bodies usually have some mechanical means for maintaining polarity.

Hermetic seal: Glass-to-metal seals at terminations. Often used improperly to describe vacuum-tight seals.

Waterproof seal: May or may not be truly *waterproof.* May prevent easy entrance of casual water by means of a rubber or other boot.

Printed circuit connector: Connectors which are used in conjunction with printed circuit boards. There are two distinctly different styles.

Edgeboard. May be called *edge* or *card.* The printed circuit (PC) board edge enters the connector.

Two-piece: One part of the connecting pair is physically attached to the PC board itself. The other part is attached to something else such as a cable or a motherboard.

Readout: Describes the arrangement at the terminating edge of a PC board. May be single or double. A double readout PC board has termination strips on each side not usually interconnected.

Ribbon connectors: A type of connector which allows flat "ribbon" cable to be attached to a round or rectangular connector but also used interchangeably for flat connectors to flat cable.

Ribbon contact connector: Describes the contacts in a rectangular connector which have a self-wiping mating action. Not the same as ribbon connector.

Solderless terminal: Any style of termination which does not require solder for a permanent connection. See *crimp* and *insulation displacement.*

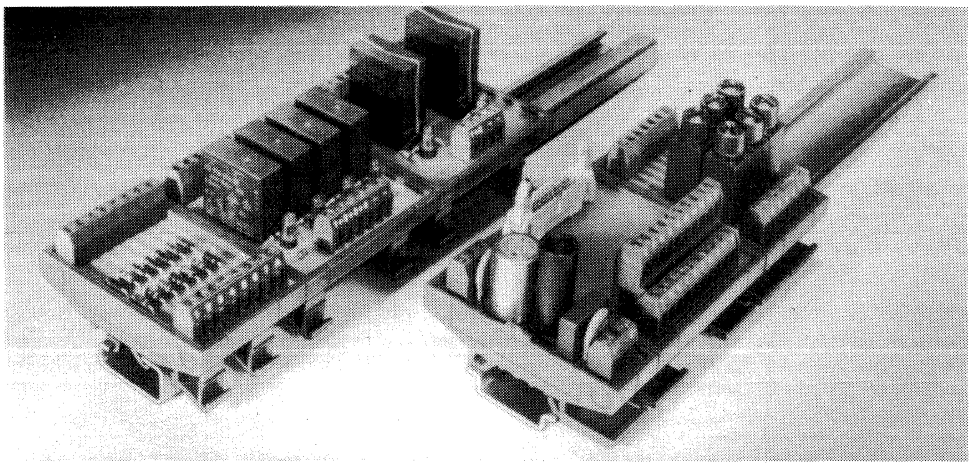
Crimp termination: A stripped wire is inserted into a barrel or trough which is then crimped to the conductor with a suitable tool.

Insulation displacement: Unstripped insulated wire is fitted into a channel containing metal teeth which are forced through the insulation to make contact with the conductor.

Service rating: The maximum rated voltage and/or current which may be applied continuously. May be called *working voltage.* Can be confused with the term used to describe how many times a connector may be mated and separated.

Withstanding voltage: Also called *test voltage.* The voltage a connector must withstand for one minute without breakdown. Applied between connectors and between connectors and shell and any grounding devices of the connector.

WECO® ELECTRONIC MODULES FOR MOUNTING RAILS TO DIN EN 50022 AND DIN EN 50035



RAIL MOUNTED MODULES

The most important criteria of todays large and complex production machinery is ease of design, cost effective maintenance and minimum down time.
Recognizing this, the industrial control and machine industry has tended towards greater centralization of components, test and disconnect points. Trouble shooters are more effective and safer if their area of activity is accessible and logically arranged.
This, amongst other things, has resulted in rail mounted terminal blocks, which have proven to be very effective.
Grouping of terminal blocks and inclusions of diodes, fuses and switches came as the next step.
Down time and cost of repair have benefitted considerably from the introduction of the more advanced rail mounted module.
One category serves as interface between controller or micro processor and power circuits, others serve as interface between two wiring systems.
Other units carry components such as diodes, fuses and varistors; or sub systems such as power supplies, opto couplers, relays etc.
Maintenance personnel are now able to identify problems in a central, well designated area without crawling around potentially dangerous machinery.
The modules listed below are suitable for all popular DIN rails as well as individual panel mounting by means of spacers.

Based on the standard program of screw-connectors for printed circuits an unmatched line of Plug-In Systems are available. A stainless steel spring provides the contact pressure to ensure a reliable connection not only to the plug, but also to other components. All systems offered provide for a quick connect and disconnect of wiring to PCB. There are many advantages and benefits to using these components:

- Subassemblies manufactured at different places are equipped with either the plug or header of the selected WECO plug-in screw-connector system. At the time the final assembly is to be finished one has only to insert the plug into the header. No more wiring is necessary.
- Peripheral appliances can be connected to the main PC-board avoiding risk of changing wires by mistake.
- For service purposes a PC-board can easily be disconnected. The plug may then be used for testing the PC-board.
- The plug also connects onto the PC-board, when direct wiring into a screw-connector is difficult because of limited space.
- Service-ability.

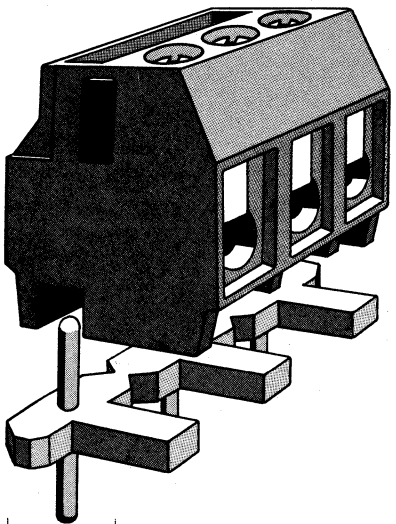
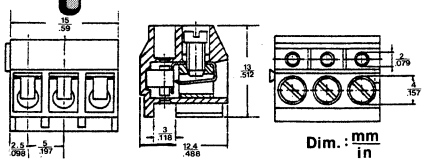
WECO® PLUG-IN SCREW CONNECTORS FOR PRINTED CIRCUITS TYPE 950-FLDS 2,3 AND 8 POLES





The female plug 950-FLDS is available with 2, 3 and 8 poles per strip. This series has the dovetail interlocking system which makes it possible to combine to any required number of poles. The mating male plugs may be individual solder pins LST-1,3×6,5 or Pin Strips 971-SLW (insertion from the top). Other versions on demand.

Pin strip and connector base design provide directional orientation when mating the two parts. A specially shaped contact spring, with integral wire protector, ensures a secure contact with relatively small insertion and removal forces.

The female plug features captive screws.

Series 900 tab type connectors offer the advantage of using receptacle equipped conductors for quick connecting and disconnecting to printed circuit boards. Instead of individually inserting the quick connect blades onto the printed circuit board, the 900 Series combines the required number of tabs into a strip. This eases the handling and cuts down on assembly time and cost. The quick connect blades come in various styles and types to meet your required plug-in directions. Apart from the standard pitch of 5, 7.5 and 10 mm, individual poles are available with regard to pitch and plug-in direction. All quick connect blades feature double pin soldering and are tightly inter-locked into the polyamide insulation housing. This ensures a reliable relief for the solder points when fitting and removing receptables.

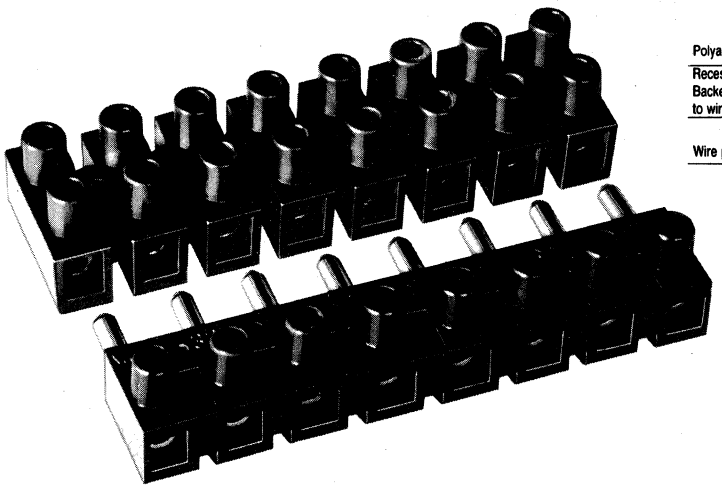
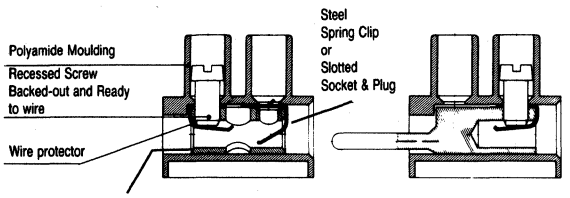
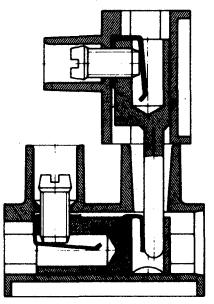
WECO® PLUG AND SOCKET SCREW-CONNECTOR SYSTEMS FOR PANEL/CHASSIS MOUNTING

Drawings see facing page.







International Approvals: **VDE rated 0110**

Plug and Socket Connectors are particularly suitable for installations where simple circuit closing and opening is required.
By pre-wiring various equipment sections, it is possible to use Plug and Socket Connectors to provide a quick and reliable connection at final assembly. Therefore wire confusion is avoided. Blocks can be coded (color coding, labelling, etc.) to ensure proper connection.

Some of these assemblies are available for printed circuit application. Standard strip has 12 circuits and can easily be field cut to required number of poles or ordered as required. A mounting hole is provided between each circuit. The terminal screws are backed out and ready for wiring. The dead front design is for safety and avoids short circuitry.

Each screw connection is equipped with a wire protector to prevent damage to the wire from the turning screw. The wire protector is a thin plate placed between screw and wire.

To obtain low contact resistances on connectors, a high contact pressure is required. This leads to relatively high withdrawal forces. To facilitate the assembly, we therefore recommend that from 7 poles onwards two male and one female plug and socket connector should be used.

For the protective conductor pole the connectors can be equipped with leading plugs or sockets on request. This means that the protective conductor connection is made first when plugging-in and disconnected last.

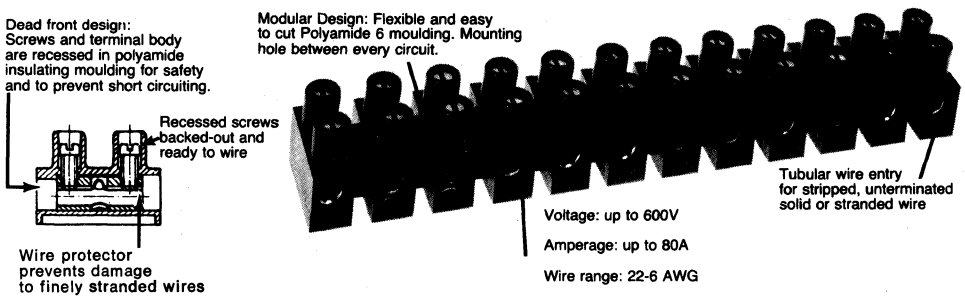
WECO® SOCKET TERMINAL STRIPS FOR PANEL/CHASSIS MOUNTING



High circuit density from 39-21 circuits per foot. Depending on product type selected.

International Approvals:

The terminal strips are used for connecting stripped, unterminated, stranded or solid copper wires; ranging from 22-6 AWG, depending on product type selected. Each strip has 12 circuits and can easily be field cut to the required number of poles. They can also be ordered factory-cut in any requested pole number.

A mounting hole is provided between each circuit. The terminal screws are backed-out and ready for wiring. The screws are protected against working loose and cannot fall out.

Each circuit has a wire protector to prevent damage to the wire from the turning screw. The wire protector is a thin steel plate placed between screw and wire. All metal parts of the terminal are completely recessed in the flexible polyamide 6 moulding. This dead-front design ensures safely and prevents short circuiting. Its flexible construction allows use on uneven surfaces. For proper circuit identification, we supply marker strips. They may either be factory numbered or individually marked with a felt pen. We can also mark on the block. The terminal strips meet most world approvals, including UL, CSA & VDE.

Terminal strip types 302 HDS and 323 HDS can be supplied with screw/solder lug connections. Please contact WECO for complete catalog.

How To Order: Please Indicate Type and No. of circuits requested, e.g.:
302 HDS-12 is terminal block 302 HDS with 12 circuits.
BST 302-12 is blank marker strip for twelve circuits. Shall marker strip be factory labelled, please provide sketch showing marking arrangement.

Newest **professional titles** have thousands of ⅛"(12 pt.) and 0.105"(10 pt.) words for both standard and micro-sized equipment control panels. Sets have 24 sheets, 3½" x 5". 12 point sets use bold face type, have one letter and one number sheet; 10 point sets are bold face titles and include 4 each, light and bold number and letter sheets. Letter and number sets have 12 indentical sheets.

Component designation sets (TERMINAL and CHASSIS MARKING sets) include 24 sheets, 3½" x 5" of sequential numbers, letters and letter combinations conforming to ANSI Y32.16 and IEEE STD 200. This series is ⅛" size only. See JotDraft #JD192-JD251 for .085" through .250" designation numbers. Coat transfers for protection. See coatings section.

DATAKOAT™ PROTECTIVE COATINGS

DATAKOAT is a 100% acrylic high-solids water-clear coating for metals and plastics. It encapsulates dry transfers in a tough film. Its solvents will not attack most plastics, lacquers or cured enamels. The dry film has a high dielectric strength, is very flexible, moderately hard and extremely resistant to weathering and UV exposure. DATAKOAT is not recommended for transfers on paper.

04176 DATAKOAT Brushcoat and Thinner Kit (1 oz. ea.)	**$3.65**
04177 DATAKOAT Gloss Spray (12 oz. net wt.)	**5.75**
04178 DATAKOAT Matte Spray (12 oz. net wt.)	**5.75**

HARDKOAT™ PROTECTIVE COATINGS

HARDKOAT is a clear, very high-solids quality cellulosic resin for paper, wood and other porous surfaces. Its solvents fuse the dry transfer into the surface while its resins bond to the surface with an extremely hard, flexible film. HARDKOAT may be used on metals and many painted surfaces where it gives superior protection against abrasion and scratching. Its solvents temporarily soften many plastic materials, so it should be used with caution. Multiple heavy coats may have a very faint yellowish tint. Use DATAKOAT if an absolutely water-clear coating is essential.

RELAY SOCKETS with Fixed or Removable Contacts!

Jan's relay sockets are specifically designed for use with plug-in relays... in electronic circuit applications which demand quick and easy assembly and maintenance.

Available with dip-solder pin terminals for printed circuit assembly, or solder cup and turret terminals for direct wiring. For applications requiring removable contacts, solderless wire crimp terminations are available for #16, 20, 22, or 24 AWG wire sizes.

A variety of mounting styles are offered including... tapped inserts with studs for top chassis mounting; thru hole; or tapped inserts with removable standoffs and screws for mounting on either side of chassis or panel. Unexpected disconnect because of vibration is eliminated by fastening the relay to the socket. Polarization dots and/or index holes (optional) aid in plugging in relay correctly. Socket contact material is spring tempered phosphor bronze gold plate over silver plate. Body material is Diallyl Phthalate, fiberglass filled per MIL-M-19833.

JAN'S MAGNETIC SHIELDS are made of MU-Metal or equal and are hydrogen annealed by a special process to assure optimum orientation of the molecular structure of the alloy for best magnetic shielding. JAN'S MAGNETIC SHIELDS prevent distortion and intensity modulation of the electron beam due to stray magnetic fields.

In addition, the use of these shields protect personnel against the dangers of accidental tube breakage. Mounting holes are tapped for No. 6-32 screws as shown. These shields are designed to fit JAN'S standard bezels as listed below. See preceding pages for specifications on JAN'S BEZEL ASSEMBLIES.

SLIP-CLUTCH KNOB with Spinners

KS-1375-(4) & KS-1376-(4)

For driving devices such as variable capacitors, inductors, potentiometers, etc., the "slip-clutch"* automatically disengages and slips when predetermined torque has been exceeded. Knobs are fluted, and equipped with either fixed or retractable spinner for fast turning. Backlash-free units safeguard against cranking beyond normal stops.

*Normally set for 3-6" lbs./in. Can be modified for other requirements.

Model K-1376-(4) is identical with K-1375 with additional feature retractable spinner. Spring loading provides positive, toggle-type action to lock spinner in open or closed position. K-1376 for use where economy of space is essential.

Cat. Nos. K-1275-(4) & 1276-(4)

In appearance, these knobs are identical with K-1375 and K-1376 but without Slip-Clutch. Molded Bakelite-to-metal-insert-construction, two set screws for attachment to shafts.

SLIP CLUTCH: Prevent over torquing delicate mechanisms. Functions as standard knob between limit stops. When limit is reached and knob rotation continues, clutch overrides the stop without applying torque in excess of specifications. Driving torque in detented position .5–6 LB./IN. (depending on knob diameter).
BRAKE KNOB: Prevents control setting from movement due to shock or vibration.

Brake Knob W/ OVERRIDING CLUTCH: Same as "PT" with added feature of "S" (slip clutch) combined. Knob can be rotated without changing setting (if not pushed in).
Brake Knob W/ Overriding Clutch & LIMIT STOP: Same as "PT" & "PSC" with added feature of limit top (320° MAX) built in.

Brake Knob W/ Overriding Clutch—PULL-TO-TURN: Same as "PSC" except pull-to-turn. For use in extremely hostile environment, i.e.: Life Support Equipment.
SPIN FREE PUSH-TO-ENGAGE: Prevents shaft from inadvertent turning—Knob spins free unless depressed and rotated until full internal engagement is accomplished for use where SHAFT TORQUE EXCEEDS 4 oz. in.

Spin Free PUSH-TO-ENGAGE: Same as "PTN" except for use where SHAFT TORQUE is LESS THAN 4 oz. in.

Spin Free PRESS-TO-TURN: (Friction) Prevents inadvertent change of setting. Use only where intent to turn is required. Must be pressed in while turning, for low torque applications.

Spin Free LIFT-TO-TURN: Same as "PTN" except pull-to-turn. For use where SHAFT TORQUE EXCEEDS 4 oz. in.

TORQUE KNOB: (Friction) For use where positive feel is deisred and/or where minor excursions of shock and vibration are anticipated.
LIMIT STOP W/ QUICK RELEASE: For use where limited travel (0–? degrees) is required. Push-To-Release stop and continue to the next function.

Same as LEPR except PULL-TO-RELEASE: For use in extremely hostile environment, i.e.: Life Support Equipment.

COLLET KNOBS

Function, styling, handling and simplicity of assembly were the designers' main criteria in the development of the Selco range of collet knobs. The various accessories (caps, pointers, figure dials and nut covers) push-fit into the basic knob to give added versatility. Caps are available in over 20 different colors.

MATERIALS

All knobs, caps, pointers and nut covers are made from Nylon and have a matte finish. The transparent figure dials are made from polycarbonate and the colored dials are of Nylon.

Collets, sleeves and nuts, installed into the knobs during manufacture, are of brass. They will accommodate a wide range of shaft lengths and bush lengths. All molded parts are stable in the temperature range −20°C to +70°C.

TURNING TORQUE

The torque that can be transmitted by knobs without slipping, assuming the knob has been adequately tightened on the shaft, is as follows:

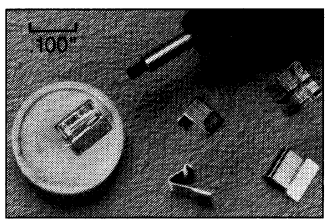
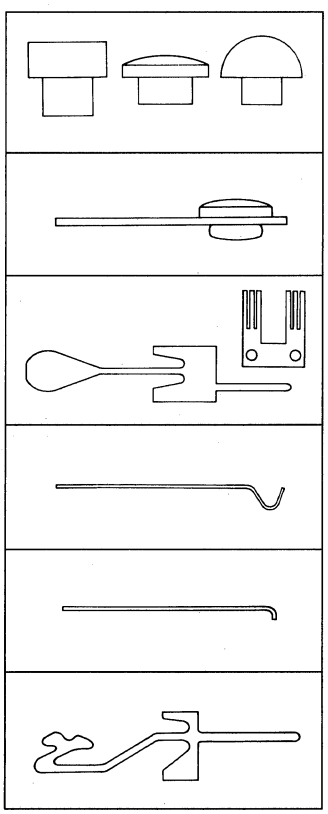
Precise, Reliable, Low-Energy Electrical Contacts

Ney manufactures high quality, precision stampings for demanding low energy (> 1 amp) electrical contacts. Precious metal stampings are a specialty. Our secure facilities and control procedures with expensive alloys have been developed through over 176 years in the precious metal business. Ney manufactures the Paliney® and Neyoro® series of contact alloys from bullion. Non-precious contact alloys are also stamped with ultra-precision.

Job volumes up to 1,000,000 parts are easily handled with automated stamping equipment. Yet, jobs as small as 1,000 parts can be done at reasonable cost. A captive tool and die shop facilitates rapid turnaround on rush jobs, and maximum control over the final product. Ney precision contacts can also be insert molded in the engineering thermoplastic of your choice.



The following are some typical low energy contact designs that Ney manufactures:



Miniature Brush Wipers

Miniature brush wipers can be made in extremely small sizes. This style of contact provides high reliability with low cost by using many points of contact. Up to 30 wires or ribbons can be placed on the busbar with positional reliability, in wire diameters between .0025" and .015". These brushes are designed to withstand vapor phase soldering temperatures.

Rivets

Solid precious metal rivets are an excellent choice for make-and-break contacts with slightly higher amp ratings (1,000 to 2,000 milliamps). These rivets are made with CNC machine or cold-headed accuracy, and can be staked in place in a variety of materials. Head diameters can be as small as .050", and shank diameters as small as .020".

Staked Contacts

Copper spring arms with precious metal rivet contacts, staked in place, provide controlled gram force contact and reliable, bi-directional, low amperage switching. Any number of contacts can be positioned along the spring arm.

Flat Stampings

Paliney® 6 or 7 can be automatically stamped into complex shapes to fit your final design. Orientation features or locking details for insert molding are accurately placed. Contact fingers can be bifurcated for reliability. These high precision stampings are ideal for sliding contact applications below 1,000 milliamps.

Knuckle Contacts

Tight radius contact knuckles provide long life and bi-directional sliding contacts. These can be placed in either flat stamped contacts or in miniature brush wipers. Contact lines can be placed very accurately with knuckle contacts.

Rake Contacts

Rake contacts present the same cross-sectional contact area as the rake wears. This contact style is popular in applications driven by repeatability. It has been especially successful in critical automotive sensor applications.

EDM Contacts

Low volume contacts with extremely complex shapes can be electro-discharge-machined from the proper base metal. For low volume runs, Ney's advanced EDM equipment provides extremely tight control over dimensions and shape. Complex curves and other unique features are easily incorporated in these contact designs.

The J.M. Ney Company is a major manufacturer of precious metal alloys, low energy electrical contacts, test & burn-in sockets and electronic products. Please see our other ads under Services, Molding (Sec. 4100) and Sockets, Test (Sec. 2100).

PERMA POWER® sockets PLUS T.M. MULTIPLE OUTLET STRIPS

Safe and convenient power distribution for

auxiliary work stations
assembly line
maintenance and repair
machine shop
test station
drafting bench
quality control center
exhibit booths

Convenient. Perma Power Sockets-Plus™ multiple outlet strips are the quickest, most convenient way to provide electric power when and where it's needed, with convenient control and complete safety. Conventional cube taps and extension cords can result in overloaded circuits and chaotic stacking of plugs into existing wall outlets. Sockets-Plus multiple outlet strips provide orderly power distribution, as well as control and safety.

A wide choice of models. Perma Power makes it easy to find the exact strip that's needed. Variables include the number of receptacles, the number of switches and indicator lights, and the length of the cords.

Extra features. On-off switches and indicator lights are extra features that put the user in complete control of his local power use! See at a glance what's on, what's off. Save steps; easily control power to any machine, computer, or lamp with handy on-off switch options.

Safe. All Sockets-Plus multiple outlet strips come with 3-wire U-ground outlets, and are housed in electrically-grounded steel cases. Because they have built-in circuit breakers, there's no danger of overloading one of the main circuits. If the power drain is too great, they shut off the power *here*, not in a fuse box somewhere down the line. The line is guarded, so users can relax!

Custom designs. Perma Power will provide custom designs, with your choice of colors, finishes, configurations and available features. Just tell us what you need and we'll get back to you promptly with a quote, minimums and delivery schedule.

MULTIPLE OUTLET STRIPS FOR INDUSTRIAL/LABORATORY

HIGH ABUSE OUTLET STRIPS WITH HOSPITAL GRADE COMPONENTS

These outlet strips are designed for applications with special safety requirements, or where equipment is exposed to fumes from corrosive chemicals or liquids. Their plugs and receptacles are "Hospital Grade"—verified by Underwriters Laboratories to have passed a series of tortuous tests assuring the user of continuous, safe operation, even in the face of human negligence and corrosive environments.

Plugs and receptacles meet or exceed these "Hospital Grade" UL tests:

Abrupt removal of plug
Ground pin retention
Terminal strength
Assembly security
Face impact
Ground contact
Temperature
Ground contact resistance
Fault current test
Mold stress relief

SURGE SUPPRESSOR OUTLET STRIPS

Protect your data and equipment from errors and damage caused by power line voltage surges. These surge protected outlet strips guard against both *normal mode* surges (line to neutral) and *common mode* surges (line to ground and neutral to ground). Each comes with a master on-off switch, indicator light, 15 amp circuit breaker, and 6 ft. power cord.

These Perma Power Surge Suppressors feature a unique failsafe Automatic Shutdown mechanism* to insure that your valuable electronic equipment is always protected. All power is stopped if the surge suppression circuitry wears or burns out. A visual indication of shutdown is provided by the pilot lamp.

There are two model groups: The single-stage models feature filtering provided by three metal oxide varistors. These models provide protection on all three conductors in a typical 120VAC circuit. The Extended Life group features four-element two-stage filtering, provided by a uniquely-engineered combination of metal oxide varistors and silicon avalanche diodes. These models assure you of protection against both powerful surges and repeated surges, and provide lower let-through voltage and longer operating life.
